List of Figures

Fig 3.1: Abstract view of Bioinformatics ................................................................. 52
Fig 3.2 Bioinformatics tools and their relation in different forms ......................... 60
Fig 3.3: Aligned Sequence....................................................................................... 61
Fig 3.4: Snap shot of Multiple Sequence Alignment............................................. 64
Table: 3.2 Table showing the Tools for Global Alignment................................... 74
Table: 3.3 Table showing the Tools for Local Alignment...................................... 75
Figure: 4.1 flow chart of Electronic Medical Records.......................................... 116
Figure: 5.1 Example of an alignment between two sequences of nucleotides...... 134
Figure 6.1. Phylogenetic tree that was constructed based on the alignment scores of all the protein sequences involved in diabetic cardiomyopathy.......................................... 155
Figure 6.2. Phylogenetic tree that was constructed based on the alignment scores of all the protein sequences involved in coronary artery disease................................................. 156
Figure 6.3. The Phylogenetic tree that was constructed based on the alignment scores of all the protein sequences involved in diabetic associated with stroke. Proteins with minimum distance............................................................................................................ 156
Figure 6.4. Schematic representation of the diabetic macrovascular complications with reference to bioinformatic and proteomic approaches for therapeutic drug target identification and/or biomarker identification................................................. 157
