SCOPE FOR THE FUTURE WORK

The present work was focused on finding the role of Supply Chain Elements and its management in Food Corporation of India for ensuring the efficacious supplies of food grains for the Targetted Public Distribution System. The researcher endeavored to explore all possible dimensions of supply chain elements being practiced in FCI in synergetic manner with the system of reaching the food grains for the beneficiary / consumer. However, like any other study, this study too have several limitations.

For the future work, the following points may be considered:

- The present study was made only on four state of Haryana, Punjab, Bihar and Delhi. The scope of the work can be enlarged to other states too keeping in view the local rules & regulations prevailing about TPDS and procurement related issues being either a deficit state or surplus state. The result of the same study conducted in South India, West India and for East and North East India may present different picture / results.

- The area of study is highly dynamic in present context. In view of the fast changes taking place in TPDS in the state and the measures and initiatives being taken by the Govt. of India for the welfare of consumers and especially in view of the Food Security Bill and concept of National Food Security being thought of gives ample scope for the future studies.

- In view of the very fast advent of computerization & automation of the system e.g Introduction of Aadhar Card and Bio-metric system of TPDS will have far reaching effects on the entire concept of TPDS since Govt. of India is seriously considering the disbursement of subsidy through cash which can altogether change the system of TPDS.
