• **Figure 4.25**: Schematic representation of pretreatment strategies used in this study

• **Figure 4.26**: Time course of saccharification of delignified lignocellulosic biomass with different fungi.

• **Figure 4.27**: Time course of fungal saccharification of delignified lignocellulosic biomass with different substrates.

• **Figure 4.28**: Time course of bacterial saccharification of delignified lignocellulosic biomass with different substrates.

• **Figure 4.29**: A comparison of sugar released by fungi and bacteria with time course.

• **Figure 4.30**: Effect of different concentrations of microorganisms (fungi) on saccharification of delignified lignocellulosic biomass.

• **Figure 4.31**: Effect of different concentrations of microorganisms (fungi) on microbial saccharification of delignified lignocellulosic biomass with different substrates.

• **Figure 4.32**: Effect of different concentrations of microorganisms (bacteria) on the delignified lignocellulosic biomass.

• **Figure 4.33**: A comparison of sugar released by fungi and bacteria with different concentrations of microorganisms

• **Figure 4.34**: Effect of different substrates consistencies on microbial saccharification of delignified lignocellulosic biomass with different fungi.

• **Figure 4.35**: Effect of different substrates consistencies on microbial (fungal) saccharification of delignified lignocellulosic biomass with different substrates.

• **Figure 4.36**: Effect of different substrates consistencies on microbial (bacterial) saccharification of delignified lignocellulosic biomass with different substrates.

• **Figure 4.37**: A comparison of sugar released by fungi and bacteria with different substrate consistencies
- **Figure 4.38**: Effect of temperature on microbial saccharification of delignified lignocellulosic biomass with different microorganisms (fungal).
- **Figure 4.39**: Effect of temperature on microbial (fungal) saccharification of delignified lignocellulosic biomass with different substrates.
- **Figure 4.40**: Effect of temperature on microbial (bacterial) saccharification of delignified lignocellulosic biomass with different substrates.
- **Figure 4.41**: A comparison of sugar released by fungi and bacteria with different temperatures.
- **Figure 4.42**: Effect of different agitation rates on microbial saccharification of delignified lignocellulosic biomass with different microorganisms (fungal).
- **Figure 4.43**: Effect of different agitation rates on microbial (fungal) saccharification of delignified lignocellulosic biomass with different substrates.
- **Figure 4.44**: Effect of different agitation rates on microbial (bacterial) saccharification of delignified lignocellulosic biomass with different substrates.
- **Figure 4.45**: A comparison of sugar released by fungi and bacteria with different agitation rates.
- **Figure 4.46**: Effect of different pH on microbial saccharification of delignified lignocellulosic biomass with different microorganisms (fungal).
- **Figure 4.47**: Effect of different pH on microbial (fungal) saccharification of delignified lignocellulosic biomass with different substrates.
- **Figure 4.48**: Effect of different pH on microbial (bacterial) saccharification of delignified lignocellulosic biomass with different substrates.
- **Figure 4.49**: A comparison of sugar released by fungi and bacteria with different pH values.
- **Figure 4.50**: Effect of different surfactants on microbial (fungal) saccharification of
delignified lignocellulosic biomass with different microorganisms.

- **Figure 4.51**: Effect of different surfactants on microbial (fungal) saccharification of delignified lignocellulosic biomass with different substrates.

- **Figure 4.52**: Effect of different surfactants on microbial (bacterial) saccharification of delignified lignocellulosic biomass with different substrates.

- **Figure 4.53**: A comparison of sugar released by fungi and bacteria with different surfactants.

- **Figure 4.54**: Effect of Tween 80 concentrations on microbial (fungal) saccharification of delignified lignocellulosic biomass with different microorganisms.

- **Figure 4.55**: Effect of Tween 80 concentration on microbial (fungal) saccharification of delignified lignocellulosic biomass with different substrates.

- **Figure 4.56**: Effect of different concentrations of Tween 80 on microbial (bacterial) saccharification of delignified lignocellulosic biomass with different substrates.

- **Figure 4.57**: A comparison of sugar released by fungi and bacteria with different concentrations of Tween 80.

- **Figure 4.58**: Box plot for time taken by the microorganisms for saccharification.

- **Figure 4.59**: Normal Q-Q plot of time taken by the microorganisms for saccharification.

- **Figure 4.60**: Time course of ethanol production from detoxified acid hydrolysate using *S. cerevisiae* at 30°C.

- **Figure 4.61**: Effect of initial pH of fermentation medium on the ethanol production by *S. cerevisiae* at 30°C in 7 days.

- **Figure 4.62**: Effect of initial pH of fermentation medium on sugar consumption by *S. cerevisiae* at 30°C.

- **Figure 4.63**: Effect of incubation temperature on ethanol production from fermentation.
medium (pH 5.5) using *S. cerevisiae* in 7 days.

- **Figure 4.64:** Effect of incubation temperature on sugar consumption from fermentation medium (pH 5.5) using *S. cerevisiae*.

- **Figure 4.65:** Effect of inoculum size on the ethanol production from fermentation medium (pH 5.5) using *S. cerevisiae* at 30°C in 7 days.

- **Figure 4.66:** Effect of inoculum size on the sugar consumption from fermentation medium (pH 5.5) using *S. cerevisiae* at 30°C.

- **Figure 4.67:** Effect of inoculum age on the biomass production from fermentation medium (pH 5.5) using *S. cerevisiae* at 30°C in 7 days.

- **Figure 4.68:** Effect of inoculum age on the biomass production from fermentation medium (pH 5.5) using *S. cerevisiae* at 30°C.

- **Figure 4.69:** Effect of soybean meal on the ethanol production from fermentation medium (pH 5.5) using *S. cerevisiae* at 30°C in 7 days.

- **Figure 4.70:** Effect of soybean meal on the sugar consumption from fermentation medium (pH 5.5) using *S. cerevisiae* at 30°C.

- **Figure 4.71:** Time course of ethanol production from microbial enzymatic hydrolysate using *Zymomonas mobilis* at 30°C.

- **Figure 4.72:** Effect of initial pH of fermentation medium on the ethanol production by *Zymomonas mobilis* at 30°C in 7 days.

- **Figure 4.73:** Effect of initial pH of fermentation medium on sugar consumption by *Zymomonas mobilis* at 30°C.

- **Figure 4.74:** Effect of incubation temperature on ethanol production from fermentation medium (pH 6.0) using *Zymomonas mobilis* in 7 days.

- **Figure 4.75:** Effect of incubation temperature on sugar consumption from fermentation medium (pH 6.0) using *Zymomonas mobilis*. 
• **Figure 4.76:** Effect of inoculum size on the ethanol production from fermentation medium (pH 6.0) using *Zymomonas mobilis* at 35°C in 7 days.

• **Figure 4.77:** Effect of inoculum size on the sugar consumption from fermentation medium (pH 6.0) using *Zymomonas mobilis* at 35°C.

• **Figure 4.78:** Effect of inoculum age on the ethanol production from fermentation medium (pH 6.0) using *Zymomonas mobilis* at 35°C in 7 days.

• **Figure 4.79:** Effect of inoculum age on the sugar consumption from fermentation medium (pH 6.0) using *Zymomonas mobilis* at 35°C.

• **Figure 4.80:** Effect of soybean meal on the ethanol production from fermentation medium (pH 6.0) using *Zymomonas mobilis* at 35°C in 7 days.

• **Figure 4.81:** Effect of soybean meal on the sugar consumption from fermentation medium (pH 6.0) using *Zymomonas mobilis* at 35°C.
