LIST OF FIGURES

Fig. 1 Location Map of the Area of Investigation.
Fig. 2 Geological Map of the Area of Study.
Fig. 2a Sample Map of the Study Area.
Figs 3, 4, 5 \( \wedge \) - Pole Diagrams of metasedimentaries, granites amphibolites-tremolite actinolite schists.
Fig. 6 Distribution of Shear Zones (G.S.I. 1984).
Fig. 7 Field photograph of Quartz-Tourmaline Vein.
Fig. 8 Field photograph of Shale Outcrop.
Fig. 9 Triangular Diagram for the Classification of Meta-sedimentaries (Winkler, 1976).
** Fig. 10 Distribution of Biotite Porphyroblasts in Biotite Phyllite.
** Fig. 11 Presence of Numerous Inclusions Within one Single Biotite Porphyroblast in Biotite Phyllite.
** Fig. 12 Development of Conjugate Schistosity in Biotite Phyllite.
Fig. 13 Niggli 'mg' versus 'K' Diagram (Leake, 1958).
Fig. 14 ACF Diagram for the Meta-sedimentaries (Winkler, 1976).
Fig. 15 A'KF Diagram for the Meta-sedimentaries (Winkler, 1976).
** Fig. 16 The General Fabric of Coarse Grained Amphibolite.
Figs 17, 18, 19, and 20 Evidence of Blasto-ophitic texture in Medium and Fine Grained Amphibolites.
** Fig. 21 Presence of Lath Shaped Plagioclase Crystals in Amphibolites.
**Fig. 22** - Development of Leucoxene in Amphibolites.

*Fig. 23* - Production of Symplectic Texture in Amphibolites.

Fig. 24 - Field photograph of Tremolite-Actinolite Schist Outcrop.

**Fig. 25** - Distribution of Actinolite Porphyroblasts in Tremolite-Actinolite Schist.

Fig. 26 - Total Alkalies (Na_2O + K_2O) Against Silica SiO_2) Diagram (Tilley, 1950).

Fig. 27 - Na_2O against SiO_2 Diagram (Wager, 1956)

Fig. 28 - Niggli 'C' versus 'mg' Diagram (Evans and Leake, 1960).

Fig. 29 - Niggli 'al-alk' against 'C' Diagram (Evans and Leake, 1960).

Fig. 30 - Niggli 'C - (al-alk) - 100 mg' Diagram (Evans and Leake, 1960).

Fig. 31 - TiO_2 -K_2O-P_2O_5 Diagram (Pearce, et al., 1975).

Fig. 32 - ACF Values of Amphibolites and Tremolite-Actinolite Schist plotted in ACF Diagram (Winkler, 1976).

Fig. 33 - Domal Shaped outcrop pattern of Granitoids.

Fig. 34 - A Direct Contact between Aggen-gneiss and Biotite-gneiss to the NE of Agajhor.

Fig. 35 - Q-P-A Diagram (I U G S classification).

**Fig. 36** - Large Megacryst of K-feldspar with perthitic intergrowth within a fine grained quartzofeldspathic groundmass.

**Fig. 37** - Development of myrmekitic structure.

**Fig. 38** - Folded Book like plagioclase megacryst set embedded in a fine grained groundmass.
**Fig. 39** Megacryst muscovite within fine grained quartzo-feldspathic mass—a manifestation recrystallisation of country rock during granitic activity.

**Fig. 40** Warping of plagioclase phenocrysts has caused pulverisation of surrounding grains.

**Fig. 41** A composite granophyric aggregate in Burabazar granite.

**Fig. 42** K₂O vs Na₂O Diagram.

**Fig. 43** Q-Ab-Or and Ab-Or-An Diagram.

**Fig. 44** A coarse to very coarse grained granitic mass comprising large phenocrysts of plagioclase (sodic), alkali-feldspar, quartz within a fine grained pulverised quartzo-feldspathic mass.

**Fig. 45** The original plagioclase-muscovite-biotite schist being granitised and as a result newly developed secondary muscovite grains obliterate the schistosity plane.

*Fig. 46* Very coarse grained amphibolite with plagioclase, hornblende, biotite, sphene—note schistose pattern of biotite arrangement.

**Fig. 47** Field photo shows injected veins of granitic melt traversing the rock outcrop.

**Fig. 48** Field photo shows formation of banded gneiss due to migmatisation.

**Fig. 49** Field photo shows warping of the country rock due to migmatisation.

**Fig. 50** Field photo shows lenses of granite within the granitised mass.

**Fig. 51** Field photo shows clustering of biotite crystals to form melanosome parts.
Fig. 52  Field photo shows formation of melanosome accompanied by localised ptygmatie folding.

Fig. 53  Field photo shows formation of pinch and swell structure formed by the invasion of pegmatitic vein within biotite granite gneiss.

Fig. 54  Field photo shows that the size of pegmatite vein may even range upto 3 m. in length and 2 m. in width.

Fig. 55  Field photo shows intensely folded migmatised rock unit.

Fig. 56  Field photo shows foliated migmatite with distinct foliation planes.

Fig. 57  Field photo shows intrusion of aplite within the migmatite.

Fig. 58  Field photo shows xenolith of migmatised gneiss within the later aplite vein material.

Fig. 59  Field photo shows regularly arranged silica veins in microgranite.

Fig. 60  Field photo shows gneissosity in microgranite body.

Fig. 61  Field photo shows amphibolite-pyroxene veinlets within the microgranite body.

Fig. 62  Very well developed dimensional parallelism shown by aegirine grains in microgranite; note the cross-cutting vein composed of aegerine and riebeckite.

Fig. 63  A thick band made up of aegirine and riebeckite associated with sphene traverses the rock unit.

Fig. 64  Mineral parageneses of Amphibolites and Tremolite-Actinolite schist, expressed in ACP Diagram.
Size of apatite crystal varies from a few mm. to several cm. and are embedded within a limoni-tised sericitised and cherty groundmass.

Fig. 65

The overgrowth of fluor-hydroxyapatite around chlorapatite.
