</table>
A2.6 Parameter estimates of Gamma model, fitted to the fertility schedules of cohorts of Indian women who ended their reproductive period in the calendar years 1993, 1999 and 2006

A2.7 Parameter estimates of the S-G model, fitted to the fertility schedules of cohorts of Indian women who ended their reproductive period in the calendar years 1993, 1999 and 2006

A2.8 Parameter estimates of PK-I model, fitted to the fertility schedules of cohorts of Indian women who ended their reproductive period in the calendar years 1993, 1999 and 2006

3.1 Formation of cohorts using NFHS-1, NFHS-2 and NFHS-3 data

3.2 Fit of the S-P model, measured in terms of error sum of squares, to the fertility schedules of cohorts of women by their socio-economic characteristics

3.3 Parameter estimates of the S-P model, fitted to the fertility schedules of India and its different regions

3.4 Parameter estimates of the S-P model, fitted to the fertility schedules of cohorts of women of various socio-economic groups who have ended/will end their reproductive period in various calendar years during 1993-2025

3.5 Changes in the ideal number of children, son preference and the number of child deaths experienced per woman, across various socio-economic groups and over cohorts

3.6 Changes in the mean age at marriage, percentage of women sterilized by the age of 30 years and the percentage having exposure to media, across various socio-economic groups and over cohorts

3.7 Gross and net effect of various factors on children ever born

A3.1 Percent having boy preference in different regions of India, over cohorts

A3.2 Average number of Infant deaths experienced by a woman in different regions of India, over cohorts

A3.3 Percent sterilized by the exact age of 30 years in different regions of India, over cohorts

List of tables
A3.4  Percent ever used any kind of traditional contraceptive methods in different regions of India, over cohorts  

A3.5  Average number of children born by the exact age of 30 years in different regions of India, over cohorts  

A3.6  Mean age at first marriage in different regions of India, over cohorts  

A3.7  Changes in female literacy rate and percentage of the couples effectively protected from getting pregnancy by some kind of contraceptive method  

4.1  Fit Statistics of the proposed analytical birth order fertility curves for India and its different regions  

4.2  Parity progression ratios in India and its different regions (up to sixth order birth)  

4.3  Probability distribution of number of children in India and its different regions  

4.4  Mean age at various order births in India and its different regions  

4.5  Fit statistics of the proposed analytical birth order fertility curves for various countries  

4.6  Parity progression ratios in various countries  

4.7  Probability distribution of number of children for the considered countries  

4.8  Mean age at various order births for the considered countries  

A4.1  Parameter estimates of the analytical birth order specific fertility curves fitted to the cohort birth order specific fertility schedules of India and its different regions  

A4.2  Parameter estimates of the analytical birth order specific fertility curves fitted to the period birth order specific fertility schedules of the considered countries  

5.1  Fit of various models to the tubal sterilization schedules of cohorts of women in India and its different regions  

List of tables  

iii
5.2 Parameter estimates of the Gompertz model, fitted to the tubal sterilization schedules of cohorts of women in India and its different regions

5.3 Some of the characteristics related to the practice of tubal sterilization in India and its different regions, over cohorts

5.4 Percentage of women sterilized on or before the age of 25 years in India and its different regions, over cohorts

5.5 Total and potential reproductive periods averted due to tubal sterilization and CTFR, in different regions of India and over cohorts

A5.1 Results of simple linear regression in which CTFR is the response variable and Total Reproductive Period Averted (TRA) due to tubal sterilization is the explanatory variable

A5.2 Results of simple linear regression in which CTFR is the response variable and Potential Reproductive Period Averted (PRA) due to tubal sterilization is the explanatory variable

6.1 Construction of unit level indices based on information about freedom of movement, managing own health and management of household finance

6.2 Effect of various factors on number of children ever born, ideal number of children, son preference and ever usage of modern contraceptive methods
