Figure 2.15 Band diagram (a) isolated W$_{18}$O$_{49}$ and Sn$_0$2 materials and (b) the corresponding heterojunction band structure for an ideal interface (i.e. charge exchange is Fermi level mediated). Ideal charge exchange results in the formation of a Macroscopic negative dipole as indicated. Region A has enhanced electron density in SnO$_2$ and region B has reduced electron density in W$_{18}$O$_{49}$. Region A with enhanced electron density may cover full nanowires as typical depletion layer width exceeds nanowire thickness.
