CONCLUSION

1. Yash scoring system is a new modified i.e. modification of already existing MASS. It was developed by adding three new parameters. Weightage to the new parameters of YASH score were given as follows : hyperesthesia in Sherren’s triangle given score one, for CRP score of three and highest score was given to USG i.e. four, depending on odds ratio, probability, diagnostic accuracy and factor analysis. Rest seven parameters were common in both score YSS and MASS, weightage kept same as per MASS.

2. Yash score is having superior result than MASS. Diagnostic accuracy of YSS is more reliable in our population.
