SCOPE, LIMITATIONS, IMPLICATIONS

This new appendicitis scoring system is easy and handy as the majority of the parameters can be obtained from a routine history, clinical examination, simple laboratory investigations (TLC and C-reactive protein) and imaging like USG.

Diagnostic accuracy for Yash scoring system was higher than the currently available scoring system including MASS.

Yash scoring system is more time consuming, less cost effective and operator dependent especially for USG. Further USG done in a obese patients is not reliable. these are the limitations of the present study.
