List of Figures

1.1 A fingerprint image with the core and minutiae points marked on it. The ridge pattern along with the core and delta points define the global configuration, while the minutiae points define the local structure. ............. 8

2.1 Poor quality fingerprint images of the same subject. ......................... 22
2.2 A typical core point located fingerprints. ........................................ 24
2.3 Cropped fingerprint image of size 100 x 100 pixels around the core point. 25
2.4 Fingerprint image and corresponding orientation image. ..................... 26
2.5 Orientation variance features and corresponding Fingerprint images. ...... 27
2.6 Orientation variance features and corresponding Fingerprint images contd... 28
2.7 Grid (10 x 10) representing the orientation of (1,1) and (m, n) block around core point. ................................................................. 29
2.8 The results of proposed rotation estimation method of test fingerprint image. (a & d): Fingerprint image 60_3 and 50_2 from DB1.a of FVC2002. (b & e): Rotated fingerprint images of 60_3 and 50_2 (60_4 and 50_3 from the database). (c & f): The fingerprint images 60_4 and 50_3 aligned with 60_3 and 50_2 using the proposed method of rotation estimation(figures are shown for illustration purpose). ........................................ 30
2.9 Fingerprint images with rotation (from FVC2002 database). ............... 31
2.10 Experimental results of fingerprint matching using orientation feature for University of Bologna database. ........................................ 35
2.11 Experimental results of fingerprint matching using orientation feature for FVC2002 database. ......................................................... 35

3.1 The Line property of Radon transform (a) A 2-D function that is only non-zero when on the line (b) The corresponding Radon transform (slant stacking). ................................................................. 39
3.2 Parallel beam projection to compute Radon transform. ...................... 40
3.3 Computation of ridgelet features. (a) A typical block of fingerprint image with an orientation 63.7 degrees. (b) Radon transform of a block in a direction orthogonal to its orientation. (c) Wavelet decomposition: approximate components. (d) Wavelet decomposition: detail components. .......... 43
3.4 Fingerprint matching results based on ridgelet features for University of Bologna database. Solid line: results using approximate ridgelet features. Dashed line: results using detail ridgelet features. ................. 46
3.5 Fingerprint matching results based on ridgelet features for FVC2002 database. Solid line: results using detail ridgelet features. Dashed line: results using approximate ridgelet features. ........................................ 47

3.6 Fingerprint images with additive gaussian white noise of (a) 15 db signal to noise ratio (b) 14 db signal to noise ratio. ................................................................. 47

3.7 Fingerprint matching results based on ridgelet features (FVC2002 database) for various signal to noise ratio. Solid line: result without adding white noise. Dash-dot line: result for 15 db signal to noise ratio. Dash-dash line: result for 14 db signal to noise ratio. ........................................ 48

4.1 Steerable filtered fingerprint images (figures a - f corresponds to orientations in 0, 22.5, 45, 67.5 90, 112.5 degrees). .................................................. 52

5.1 Variations in ridge frequency from the same fingerprint. ......................... 56

5.2 Gabor filter response in spatial domain at eight different orientations (figures a - h corresponds to orientations in 0, 22.5, 45, 67.5 90, 112.5, 145, 167.5 degrees). ........................................... 58

5.3 An orthogonal projection of a typical block in a fingerprint. .................... 59

5.4 Modified Gabor filtered fingerprint image. ........................................... 60

5.5 Fingerprint verification results for Multiresolution Gabor Feature algorithm. 62

5.6 Fingerprint verification results for algorithm in which Gabor features are computed at constant frequency. .................................................. 63

6.1 Different fingerprint Classes suggested by Henry-Galton ((a)-Right loop, (b)-Left loop, (c)-Arch, (d)-Tented arch, (e)-Whorl). ........................................... 66

6.2 Different types of fingerprints of whorl class. .................................... 73

7.1 Fingerprint images from FVC2002. (a) poor quality fingerprint image (b) fingerprint with translation (c) fingerprint with rotation. .......................... 77

7.2 Grid used for computation of correlation. .......................................... 79

7.3 Steps involved in Correlation based segmentation. (a) original image (b) correlation image (c) image after applying 5x5 morphological operator (d) segmented image using morphological mask. ........................................ 81
7.4 Some results of segmentation algorithm. (a),(b) segmented image and original image of good quality (c),(d) segmented image and original image of poor quality (dry) (e),(f) segmented image and original image of moderate quality.
