LIST OF TABLES

Table 3.1  Primer sequences of genes analyzed using real time PCR ...............35

Table 3.2. Primer sequences used to create the RS1 mutant constructs by site directed mutagenesis and Gibson assembly ..................38

Table 3.3. Details of primers used to amplify the wild type and mutant cDNA segments .................................................................................................................43

Table 4.1. Demographic details of patients clinically diagnosed with retinoschisis ..........................................................................................................................56

Table 4.2. List of patients and their clinical characteristics ..................................57

Table 4.3. Optical coherence tomography (OCT) characteristics of patients with retinoschisis ........................................................................................................58

Table 4.4. List of RS1 gene mutations identified in the patients .........................68

Table 4.5. List of identified RS1 mutations with their secretory profile and clinical features ...........................................................................................................86

Table 4.6. Comparison of clinical parameters between non-secreted and secreted group .............................................................................................................87

Table 4.7. Comparison of ERG parameters in control samples and XLRS patients showing non-secreted or secreted protein profile ..................................................................................................................88

Table 4.8. Clinical data of XLRS patients showing non-secreted protein profile .........................................................................................................................89

Table 4.9. Structural effects of various RS1 mutations as inferred by in silico analysis .............................................................................................................101

Table 4.10. Representative list of proteins with high NSAF value detected in the intraschisis fluid .................................................................116

Table 4.11. Diseases and disorders related to the proteins detected in the intraschisis fluid .................................................................................................120

Table 4.12. Molecular and cellular functions related to the proteins detected in the intraschisis fluid ..................................................................................120

Table 4.13. Candidate proteins involved in the predominant canonical pathways that were identified in the intraschisis fluid proteome .............................................................................................................121
