LIST OF FIGURES

Figure 1.1. OCT image of normal human retina..........................................................5
Figure 1.2. Representative clinical images and data of XLRS patient ......................8
Figure 1.3. Schematic representation of the RS1 gene, its mRNA and protein product.........................................................................................10
Figure 1.4. Pictorial illustration of retinoschisin protein...........................................12
Figure 1.5. Pictorial representation of retinoschisin synthesis and assembly in the endoplasmic reticulum ..................................................14
Figure 1.6. Picture depicting the effect of various point mutations on retinoschisin synthesis, folding and oligomerization ......................20
Figure 2.1. Pictorial representation of the work flow and study methodology.................................28
Figure 3.1. Pictorial representation of RS1 mutant construct created using Quickchange site directed mutagenesis kit. .................................36
Figure 3.2. Representative illustration of the cloning of RS1 mutant constructs by homologous recombination based Gibson assembly.................................................................38
Figure 4.1. Representative fundus photographs of patients clinically diagnosed with retinoschisis. .................................................................54
Figure 4.2. Representative electroretinogram (ERG) of XLRS patients. .................55
Figure 4.3. Representative optical coherence tomography images of retinoschisis patients. ..............................................................................56
Figure 4.4. Clinical images and data of RS patient with systemic defect.............59
Figure 4.5. Clinical images of patients with suspected Norrie disease..............61
Figure 4.6. Representative pedigrees of the affected families ...............................62
Figure 4.7. Picture illustrating the genetic screening approaches adopted to screen the patients ..............................................................66
Figure 4.8. Pie chart showing the proportion of mutations in various domains of the RS1 gene, identified in the Indian cohort ..........................68
Figure 4.9. Results of genetic analysis of RS patient with systemic defect.................................................................72
Figure 4.10. Results of genetic analysis of patients with suspected Norrie disease ................................................................. 74

Figure 4.11. Western blot analysis of wild type (WT) and mutant RS1 proteins ........................................................................... 80

Figure 4.12. Analysis of RNA expression and protein synthesis of the RS1 nonsense mutant Q117*. ............................................................. 81

Figure 4.13. Graphical representation of ERG parameters between non-secreted and secreted group. ....................................................... 92

Figure 4.14. Picture illustrating the hypothetical secretory phenomenon of RS1 ............................................................... 94

Figure 4.15. Immunocytochemistry displaying the expression and distribution of WT RS1 and various non-secreted RS1 mutants across the cell ........................................................................................ 96

Figure 4.16. Plasma membrane localization of WT and non-secreted mutant RS1 ............................................................................. 98

Figure 4.17. Tertiary structure and backbone RMSD graph of WT and RS1 mutants inferring the differences in backbone stability ........... 100

Figure 4.18. Picture depicting the four possible mechanisms of XLRS disease causation and severity ..................................................... 104

Figure 4.19. Gene ontology based categorization of proteins identified in the RS1 immunoprecipitation complex, analyzed by MALDI-TOF mass spectrometry ......................................................... 107

Figure 4.20. Interaction network map of RS1 generated using public databases ............................................................................. 109

Figure 4.21. Co-immunoprecipitation assay showing the lack of physical interaction between RS1 and NDP ................................................. 110

Figure 4.22. Interaction network map showing the functional relationship between RS1 and NDP, generated using STRING ........................ 111

Figure 4.23. Gene ontology based classification of proteins identified in the intraschisis fluid .................................................................. 118

Figure 4.24. Pictorial representation of proteins common between schisis fluid and other ocular tissues ......................................................... 122

Figure 4.25. Picture illustrating the hypothetical mechanism that may contribute to the pathogenesis of XLRS .............................. 128
