List of Figures

1 Location of the sampling stations ................................................. 161
2 Growth rate of marine yeasts isolated from Arabian Sea ............. 167
3 Yeast isolates in YM agar medium A- Candida; B- Debaromyces; C- Pichia; D- Rhodotorula; E- Trichosporon; F- Cryptococcus .................................................. 172
4 Generic composition of yeasts from sea water and sediments of Arabian Sea ................................................................. 172
5 Percentage of fermentative and oxidative nature of marine yeasts in Arabian Sea ................................................................. 176
6 Percentage of oxidative and fermentative nature of marine yeasts at different depth ranges in Arabian Sea .................... 177
7 Percentage of hydrolytic enzyme production by marine yeasts from Arabian Sea ................................................................. 178
8 Percentage of hydrolytic production by marine yeasts from different depth regions, a – 200m depth, b – 500m depth and c - 1000m depth ................................................................. 179
9 Percentage of hydrolytic production by various yeast genera ................................................................. 180
10 Hydrolytic potential of the yeast isolates; A - Amylase activity; B - Gelatinase activity; C - Lipase activity; D - Urease activity ................................................................................. 181
11 Shannon-wiener diversity ................................................................. 182
12 Peilou’s evenness ........................................................................ 182
13 Species richness .......................................................................... 182
14 Species Dominance ...................................................................... 183
Dendrogram of depth wise similarity index of marine yeasts ................................................................. 183

Dendrogram of station wise similarity index of marine yeasts ................................................................. 184

Screening yeast isolates for the production of exomannan and cell wall mannan (a, b and c) ....................... 185

Agarose gel electrophoresis of Yeast genomic DNA of Meyerozyma guilliermondii (MBTU_MYW1) amplified with 18S F and R primers ............................................................ 187

A bootstrapped neighbor joining tree obtained using MEGA version 4.0 illustrating the relationship between the ITS sequence of Meyerozyma guilliermondii with relevant sequences of some reference strains downloaded from the National Center for Biotechnology Information Database (http://www.ncbi.nlm.nih.gov/). ........................................ 188

Meyerozyma guilliermondii cells on YM agar medium .......... 189

Light Micrograph of Meyerozyma guilliermondii cells .......... 189

Scanning Electron Micrographs of Meyerozyma guilliermondii cells .......................................................... 190

Scanning Electron Micrographs of Meyerozyma guilliermondii cells aggregated in highly hydrated polysaccharides ................................................................. 190

Effect of incubation period on production of exomannan .......... 191

Effect of temperature on production of exomannan ................. 192

Effect of initial pH on production of exomannan .................. 192

The time course of exomannan synthesis .......................... 196

Cell wall mannan biosynthesis - Yeast grown on YM agar (A), after alkali treatment (B), precipitation with ethanol (C), precipitated cell wall mannan (D&E), after centrifugation (F) and purified cell wall mannan (G) .......... 197
Exomannan biosynthesis - Yeast grown on YM agar (A), Yeast cells in optimized medium (B), after shake culture experiment for 120h (C), after ethanol precipitation (D), after centrifugation (E) and purified exomannan (F) .......................... 197

SEM images of Morphological alterations of MBTU_MYW1 cells during mannan synthesis (a - control; b - 0 hr; c - 24 hrs; d - 48 hrs; e - 72 hrs; f - 96 hrs; g - 120 hrs; h - 144 hrs) ................................................................. 200

(a) and (b) Scanning electron micrographs of exomannan .......... 201

EDX spectrum showing the elemental composition of exomannan ........................................................................ 201

(a) and (b) Scanning electron micrographs of cell wall mannan.................................................................................. 202

EDX spectrum showing the elemental composition of cell wall mannan ................................................................. 202

TEM image of (a) exomannan and (b) cell wall mannan obtained on a 400 mesh copper grids ........................................ 203

TLC chromatogram of crude polysaccharides from Meyerozyma guilliermondii EPS – exomannan; CBP – Cell wall mannan ................................................................................................................. 204

UV - visible spectrum of (a) exomannan and (b) cell wall mannan ............................................................................... 205

HPLC-GPC of (a) Mannan from Saccharomyces cerevisiae, M7504 (Standard), (b) exomannan and (c) cell wall mannan ......................................................................................................................... 207

MALDI-TOF MS Spectra of (a) exomannan and (b) cell wall mannan ................................................................................. 208

(a) and (b) GC-MS Spectra of cell wall mannan ...................... 211

(a) and (b) GC-MS Spectra of exomannan ............................... 212

FT-IR Spectra of (a) cell wall mannan and (b) exomannan ....... 216
FT-Raman Spectra of (a) Mannan from *Saccharomyces cerevisiae*, M7504 (Standard), (b) cell wall mannan and (c) exomannan ................................................................. 220

$^1$H NMR spectra of (a) Mannan from *Saccharomyces cerevisiae*, M7504 (Standard), (b) exomannan and (c) cell wall mannan ........................................................................................................ 223

$^{13}$C NMR spectra of (a) Mannan from *Saccharomyces cerevisiae*, M7504 (Standard), (b) exomannan and (c) cell wall mannan ........................................................................................................ 225

HSQC (a), HMBC (b) and COSY (c) NMR spectra ......................... 228

Possible structure of *Meyerozyma guilliermondii* mannan, Manp denotes a D-mannopyranose unit (a), Possible chemical structure of *Meyerozyma guilliermondii* mannan (b) ........................................................................................................ 229

Superoxide anion scavenging activity of yeast mannans with reference standard Gallic acid ............................................. 231

Hydrogen peroxide scavenging activities of yeast mannans with reference standard Gallic acid ................................................. 233

DPPH scavenging activities of yeast mannans with reference standard Gallic acid ........................................................................ 255

Reducing power of yeast mannans with reference standard vitamin C ................................................................................................. 257

Chelating effect on metal ion of yeast mannans with reference standard EDTA ....................................................................................... 238

ABTS$^{•+}$ radical scavenging activity of yeast mannans with standard Trolox ............................................................................................. 240

Cytotoxicity of cell wall mannan, exomannan and doxorubicin (standard) on MCF-7 cell lines by MTT ........................... 242

Cell viability of MCF-7 cell line and HEK-293T treated with (a) cell wall mannan and (b) exomannan .................... 243
Cytotoxicity of cell wall mannan, exomannan and doxorubicin (standard) on MCF-7 cell lines by SRB.................. 245

Morphological analysis of the effects of mannans on MCF-7 at 62.5, 250 and 1000 µg/ml of incubation.................. 246

Cytotoxicity of cell wall mannan and exomannan on MCF-7 cell lines by LDH assay........................................... 247

Effect of cell wall mannan and exomannan on Caspase 3 in MCF-7 cell lines .................................................. 248

DNA fragmentation on MCF-7 cell line ........................................ 249

MCF-7 cells stained by the TUNEL technique counterstained with methyl green. (a) MCF-7 control, showing few brown staining of MCF-7 cells (arrows). (b) and (c) MCF-7 treated with cell wall mannan showing abundant brown staining of cells (arrows). Original magnifications, a, b, and c : 40 ×. ........................................ 250

MCF-7 cells stained by the TUNEL technique counterstained with methyl green. (a) MCF-7 control, showing few brown staining of MCF-7 cells (arrows). (b) and (c) MCF-7 treated with exomannan showing abundant brown staining of cells (arrows). Original magnifications, a, b, and c : 40 ×. ........................................ 251
