This study involved patients or cases reported at only two healthcare facilities. Hence, the data generated from this study cannot be generalized to draw conclusions to reflect the regional status.

The study did not include the patients who visited the study facility to seek advice on poisoning management/first aid/traumatic measures but were not hospitalized.

The data obtained from this study may reflect the current scenario and hence the data pertaining to the epidemiology and magnitude of poisoning cannot always be considered in developing the strategies to prevent/minimize the incidence of poisoning cases.
