## Contents

1 Introduction

1.1 Basic definitions and lemmas ........................................ 4

1.2 New definitions .................................................................. 17

1.3 A survey of results .......................................................... 18

1.4 Summary of the thesis ....................................................... 22

1.5 List of publications .......................................................... 26

2 Gallai and anti-Gallai graphs .............................................. 28

2.1 Gallai and anti-Gallai graphs ............................................ 29

2.2 Forbidden subgraph characterizations ............................... 32

2.3 Applications to cographs .................................................. 37

2.4 Chromatic number .......................................................... 40

2.5 Radius and diameter ....................................................... 42
# Domination in Graph Classes

3.1 Cographic domination number

3.2 Global cographic domination number

3.3 Two constructions

3.4 Complexity aspects

3.5 Domination in NEPS of two graphs

# The $< t >$-property

4.1 Clique transversal number

4.2 Cographs and clique perfect graphs

4.3 Planar graphs

4.4 Perfect graphs

4.5 Trestled graph of index $k$

4.6 Highly clique imperfect graphs

# Clique graphs and cographs

5.1 Clique graph of a cograph

5.2 Chromatic number of the clique graph

5.3 Some graph parameters
6 Clique irreducible and weakly clique irreducible graphs 84

6.1 Iterations of the line graph 85

6.2 Gallai graphs 92

6.3 Iterations of the anti-Gallai graph 99

6.4 Cographs ................................ 102

6.5 Distance hereditary graphs .............................. 107

List of some open problems 114

List of symbols 115

Bibliography 117

Index 125
