Suggestions for future research

Agglomerated foods have been developed to meet the convenience of the consumers with particular reference to ease in food preparation. At the same time, the concept of instantiation can be incorporated to have a well-defined improved product quality. Hence, there is a scope to have instantised-agglomerated raw materials and products to offer maximum convenience. In addition, understanding of agglomeration process with particular reference to mechanism of particle adhesion is yet to be well documented. More scientific studies may be directed towards this aspect such that newer products of commercial importance may be developed in the near future.
