Contents

1 Introduction 1

2 Thermodynamic Fluctuations and Functional Form of Clustering Parameter $b$ 16

2.1 Correlation volume and functional form of $b$ 22

2.2 Thermodynamic curvature from Riemannian geometry and the functional form of interaction parameter 26

2.3 Functional form of interaction parameter from Riemannian geometry 29

3 Fluctuations of Non-point Mass Galaxy Distribution 32

3.1 Thermodynamic fluctuations and cosmic energy equation for extended structures 35

3.2 Power index law and density fluctuations 41

3.3 Effect of extended structure on galaxy clustering 43

3.4 Solution for open and closed models 45
3.4.1 Open model ........................................ 45
3.4.2 Closed model ........................................ 50

4 Riemannian Geometric Approach to Thermodynamic Fluctuation Theory 63
4.1 Functional form of clustering parameter ........................................ 64
4.1.1 Functional dependence of $b$ on pressure $P$ and temperature $T$ .................. 64
4.1.2 Exact form of $b$ in terms of pressure and temperature .................. 66
4.2 Thermodynamic Riemannian curvature ........................................ 68
4.2.1 General expression ........................................ 68
4.3 Metric elements and their derivatives using free energy $\phi$ ................ 73
4.4 Application to physical problems ........................................ 76
4.4.1 Curvature of ideal gas ........................................ 76
4.4.2 Curvature of gravitationally interacting galaxies .................. 78
4.5 Free energy at critical point ........................................ 80

5 Gravitational Clustering of Strongly Degenerate System of Galaxies 82
5.1 Gravitational partition function for strongly interacting system 84
5.2 Exact equations of state ........................................ 93
5.3 Distribution function ........................................ 97
5.4 Moments for extended structures ........................................ 99
