Chapter-1

Fig-1.1: Some considerations leading towards integrated optical planar waveguide sensors

Chapter-2

Fig-2.1: Asymmetric step index planar waveguide. Right: refractive index profile, where $n_f > n_s \geq n_c$.

Fig-2.2: Graded index planar waveguide

Fig-2.3: Schematic view of Integrated Optic waveguide sensor structure

Fig-2.4: (a) Asymmetric planar waveguide and (b) Zig-zag trajectory of a ray inside the film

Fig-2.5: Radiation mode in an asymmetric step-index planar waveguide

Fig-2.6: Ray path followed by a substrate radiation mode

Fig-2.7: Guided mode in an asymmetric planar waveguide, showing the ray path

Fig-2.8: Ray tracing a zig-zag path in an asymmetric step-index planar waveguide

Fig-2.9: Geometry used for the analysis of propagating modes in an asymmetric step-index planar waveguide

Fig-2.10: Range of values for the propagation constant $\beta$ and the effective refractive index $N$ for guided modes, substrate modes and radiation modes

Fig-2.11: Position of the effective refractive index $N$, relative to the refractive indices of the waveguide structure, for a mode close to the cut-off

Fig-2.12: Substrate radiation mode in an asymmetric step-index planar waveguide

Fig-2.13: Radiation mode in an asymmetric step-index planar waveguide

Fig-2.14: Analytical model of effective index method for 3D waveguide geometry

Fig-2.15: Classification of optical sensors

Fig-2.16: Basic structure of an optical fiber

Fig-2.17: Basic components of an optical fiber sensor system

Fig-2.18: Intrinsic fiber optic sensor
List of Figures

Fig-2.19: Evanescent wave fiber optic chemical sensor
Fig-2.20: Fluorescent fiber optic sensor probe
Fig-2.21: Bragg grating response, where $\lambda_g =$Bragg wavelength and $\Lambda =$grating period.
Fig-2.22: Schematic diagrams of (a) Michelson interferometer and (b) Mach-Zehnder interferometer
Fig-2.23: Polarization-based fiber optic sensor
Fig-2.24: a) Top-view of an IO MZI structure and b) Behavior of the modal field distribution in the waveguide structure
Fig-2.25: Evanescent wave sensor
Fig-2.26: Formation of evanescent wave
Fig-2.27: Penetration depth
Fig-2.28: The waveguide sensor: general working principle
Fig-2.29: Basic IO sensor effect. Changes $\Delta N$ of the effective refractive index $N$ of a guided mode are induced by changes of the refractive-index distribution $n(z)$ in the vicinity of the waveguide surface, i.e., within the penetration depth $\Delta z_c$ of the evanescent field in the sample C. Sensor effect (1): molecules transported by convection or diffusion adsorb on the surface forming an adlayer $F'$ of thickness $d_F$ and refractive index $n_{F'}$. Sensor effect (2): homogeneous change $\Delta n_c$ of refractive index of (liquid) sample C

Fig-2.30: Calculated sensitivities $\frac{\partial N}{\partial d_F}, \frac{\partial N_{TM_0}}{\partial d_F}$ for $TE_0$ and $TM_0$ modes, and sensitivity $-\frac{\partial \tilde{N}}{\partial d_F}$ of difference interferometer vs. waveguide thickness $d_F$ for adsorption of H$_2$O molecules from a gaseous sample, where $\tilde{N} = N_{TE_0} - N_{TM_0}$, $n_e = 1$, $n_F = 1.33$, $\lambda = 633$ nm. Top, waveguide of type (a) with parameters $n_F = 1.80$ and $n_s = 1.47$; bottom, waveguide of type (b) with parameters $n_F = 2.01$ and $n_s = 1.46$
List of Figures

Fig-2.31: Calculated sensitivities $\frac{\partial N_{TE}}{\partial n_c}, \frac{\partial N_{TM}}{\partial n_c}$ for TE₀ and TM₀ modes, and sensitivity $-\frac{\partial N}{n_c}$ of difference interferometer as a differential refractometer for aqueous solutions vs. waveguide thickness dᵢ, nₑ=1.33, λ=633 nm. Top waveguide of type (a); bottom, waveguide of type (b) as in Fig. 2.30

Fig-2.32: Calculated sensitivities $\frac{\partial N_{TE}}{\partial n_F}, \frac{\partial N_{TM}}{\partial n_F}$ for TE₀ and TM₀ modes, and sensitivity $\frac{\partial N}{n_c}$ of difference interferometer related to adsorption of molecules from a gaseous sample C inside the microporous wave guiding film F vs. its thickness dᵢ, nₑ=1 and λ=633 nm respectively

Fig-2.33: Schematic diagram of a five-layer nonlinear asymmetric metal-clad planar waveguide with their refractive indices

Fig-2.34: Step-index slab waveguide of width w and substrate, guide, and cover refractive indices nₛ, nᵢ, and nₑ.

Fig-2.35: Schematic structure of integrated waveguide sensor with a metamaterial layer

Fig-2.36(a): Schematic cross section of the Si₃N₄/SiO₂ ring slot-waveguide used for optical sensing of biomolecules. Triangles and Y-shaped symbols represent antigen and antibody molecules, respectively

Fig-2.36(b): Calculated quasi-TE mode of the ring slot-waveguide turning to the left (−x axis) with a radius of curvature of 70 μm and an operation wavelength of 1.3 μm

Fig-2.37: Planar sensor structure

Fig-2.38: (a) Schematic view of a slot-waveguide. (b) Calculated Eₓ profile of the quasi-TE eigen mode in a Si (nₛ = 3.45)/SiO₂ (nₛ=nₑ=1.44) slot-waveguide
List of Figures

at a wavelength of 1.55 μm. E-field is enhanced in the nano scale slot-region of refractive index $n_s$

Fig-2.39: Diagram of a composite optical waveguide structure

Fig-2.40: A schematic diagram of the slab waveguide sensor under consideration

Fig-2.41: Experimental set up for solution concentration sensing

Fig-2.42: (a) Structure of the composite OWG and the principle of operation. $n_s$, $n_{B+}$, and $n_f$ are respectively, refractive index of the substrate (1.515), the K+-ion-exchanged layer (1.5195), and of the thin film. (b) Structure of the ion-exchanged composite OWG. The arrow shows how the guided light is transferred from one part of the OWG to another part via adiabatic transition

Fig-2.43: Schematic structures of the two types of waveguide sensors: (a) conventional waveguide sensor; (b) multilayer integrated waveguide sensor

Fig-2.44: Schematic representation of the slab waveguide under study. The grey area indicates the normal electric field component of the TM mode in a large-guidance waveguide
