CHAPTER 9

RECOMMENDATIONS FOR FURTHER WORK.
Chapter 9. Recommendations for further work

Mulberry silk is such a fine fibre that even very good quality fine counts can be spun from this in blends for shirtings, sarees and dress materials provided a fibre with matching denier and length is available. Following are the recommendations for further work:

- Kawabata evaluation of all the blends can be done to find the best blend ratio from comfort point of view.
- Dyeing behaviour of 100% silk, silk-blended and silk covered core-spun fabrics can be done.
- For processing silk, new kinds of opening, carding machines and wire point geometry can be designed keeping in view fine denier and static charge generation problem of the silk fibres.
