Acknowledgements                                            i  
Synopsis                                                     ii  
List of Figures                                              v  
List of Tables                                               vi  

1  **Introduction**                                         1  
   1.1 Microstructure of polycrystalline materials           1  
   1.2 Effect of microstructure on the properties of polycrystalline materials . 4  
   1.3 Microstructural changes due to plastic deformation    5  
   1.4 Microstructural changes due to ion irradiation        7  
   1.5 Microstructural changes due to annealing              8  
   1.6 Techniques of microstructural characterization        10  
   1.7 Characterization of microstructure by X-ray diffraction technique . 12  
   1.8 Zirconium and Stainless steel based alloys as core structural materials in nuclear technology . 13  
   1.9 Scope of the thesis                                   16  

2  **Experimental and Method of Analysis**                  18  
   2.1 Preparation of samples                                18  
   2.1.1 Preparation of heavily deformed powder specimen    18  

vii
2.1.2 Preparation of irradiated specimen ................................. 18
2.2 Collection of X-ray Diffraction Data ................................. 21
2.3 Characterization of microstructure by X-ray Diffraction Line Profile Analysis (XRDLPA) ............................................. 21
2.4 Different model based techniques of XRDLPA ......................... 25
  2.4.1 Single peak analysis by Scherrer’s method ......................... 25
  2.4.2 Single peak analysis by simplified breadth method ............... 26
  2.4.3 Double voigt method ............................................. 27
  2.4.4 Williamson-Hall method .......................................... 28
  2.4.5 Modified Rietveld method ........................................ 29
2.5 Microstructural Characterization by XRDLPA: a brief review ......... 36
2.6 Positron annihilation spectroscopy .................................... 37
  2.6.1 The two-state trapping model ................................... 39
  2.6.2 Positron annihilation spectroscopy: the experimental details .. 41

3 Study of Microstructure of Oxygen Irradiated Zr-1Nb Alloy using XRD and PAS ........................................ 43
  3.1 Introduction ............................................................. 43
  3.2 Objective of the present study ....................................... 44
  3.3 Experimental details .................................................. 44
  3.4 Method of analysis .................................................... 45
  3.5 Results and discussion ................................................. 46
  3.6 Conclusion ............................................................... 57

4 Studies of Microstructural Imperfections of Powdered Zirconium Based alloys ........................................ 58
  4.1 Introduction ............................................................. 58
  4.2 Objective of the present study ....................................... 59
  4.3 Experimental ........................................................... 60
