List of Figures

2.1 Gaussian Plume Dispersion ............................................................... 6
2.2 Scheme of ground reflection of Gaussian Plume Model ...................... 7
2.3 Plume behaviour under various stability conditions of Stability. Broken lines at left are dry adiabatic lapse rates. Solid lines are existing lapse. ... 12

3.1 A GFN $\tilde{A} = (a, b, c, d, h_L, h_R)$ with different left height and right height. 27
3.2 GFN $\tilde{A} = (0, 10, 11, 12, 0.5, 0.6)$ with quartiles $m_{25} = 5.7879$, $m_{50} = 8.1854$ and $m_{75} = 10.6569$. .................................................. 38
3.3 GFN $\tilde{A} = (0, 2.5, 3.5, 4.5, 0.8, 0.9)$ with quartiles $m_{25} = 1.8957$, $m_{50} = 2.8707$ and $m_{75} = 3.4233$. .................................................. 39

4.1 Cumulative distribution functions of ammonia concentration (mg/m³) at different $\alpha$-cuts for stability B ..................................... 50
4.2 Membership functions of ammonia concentration (mg/m³) generated from the 30th, 60th and 90th percentiles of the cumulative distribution functions at stability B ................................................. 50
4.3 Cumulative distribution functions of ammonia concentration (mg/m³) at different $\alpha$-cuts for stability D ..................................... 51
4.4 Membership functions of ammonia concentration (mg/m³) generated from the 30th, 60th and 90th percentiles of the cumulative distribution functions at stability D ................................................. 51
4.5 Cumulative distribution functions of ammonia concentration (mg/m³) at different $\alpha$-cuts for stability E ..................................... 52
4.6 Membership functions of ammonia concentration (mg/m³) generated from the 30th, 60th and 90th percentiles of the cumulative distribution functions at stability E ................................................. 52
4.7 Cumulative distribution functions of ammonia concentration (mg/m³) at different $\alpha$-cuts for stability F ..................................... 53
4.8 Membership functions of ammonia concentration (mg/m³) generated from the 30th, 60th and 90th percentiles of the cumulative distribution functions at stability F ................................................. 53
4.9 Bounds (Supports of 30th percentile fuzzy numbers) of the ammonia concentration for various stability categories along the downwind distance. ................................................................. 54
4.10 Bounds (Supports of 60th percentile fuzzy numbers) of the ammonia concentration for various stability categories along the downwind distance. ................................................................. 54
4.11 Bounds (Supports of 90th percentile fuzzy numbers) of the ammonia concentration for various stability categories along the downwind distance. ................................................................. 54

5.1 Cumulative distribution functions of ammonia concentration (mg/m³) at different α-cuts by the SRSM for stability B. ................................................................. 71

5.2 Cumulative distribution functions of ammonia concentration (mg/m³) at different α-cuts by the SRSM for stability D. ................................................................. 71

5.3 Cumulative distribution functions of ammonia concentration (mg/m³) at different α-cuts by the SRSM for stability E. ................................................................. 72

5.4 Cumulative distribution functions of ammonia concentration (mg/m³) at different α-cuts by the SRSM for stability F. ................................................................. 72

6.1 The P-box of ammonia concentration (mg/m³) by the method of Probability Bound Analysis and the SRSM for the stability category B. The outer P-box (red lines) is due to Probability Bound Analysis and inner P-box (black lines) is due to the SRSM. ................................................................. 85

6.2 The P-box of ammonia concentration (mg/m³) by the method of Probability Bound Analysis and the SRSM for the stability category D. The outer P-box (red lines) is due to Probability Bound Analysis and inner P-box (black lines) is due to the SRSM. ................................................................. 85

6.3 The P-box of ammonia concentration (mg/m³) by the method of Probability Bound Analysis and the SRSM for the stability category E. The outer P-box (red lines) is due to Probability Bound Analysis and inner P-box (black lines) is due to the SRSM. ................................................................. 86

6.4 The P-box of ammonia concentration (mg/m³) by the method of Probability Bound Analysis and the SRSM for the stability category F. The outer P-box (red lines) is due to Probability Bound Analysis and inner P-box (black lines) is due to the SRSM. ................................................................. 86

7.1 Membership functions of average wind speed (\( \bar{u} \)) successively fixing friction velocity \( u_* \), von Karman constant \( k_a \) and surface roughness length \( z_0 \). ................................................................. 94

7.2 Membership function of Horizontal Dispersion Co-efficient (\( \sigma_{xy} \)) successively fixing average wind speed \( \bar{u} \), friction velocity \( u_* \), heat flux \( w_* \) and boundary layer height \( h \). ................................................................. 98

7.3 Membership function of Vertical Dispersion Co-efficient (\( \sigma_{xy} \)) successively fixing average wind speed \( \bar{u} \), friction velocity \( u_* \), heat flux \( w_* \) and boundary layer height \( h \). ................................................................. 99

7.4 Membership function of Concentration (\( \chi \)) successively fixing average wind speed \( \bar{u} \), friction velocity \( u_* \), heat flux \( w_* \) and boundary layer height \( h \). ................................................................. 100

8.1 Membership function of the input uncertain parameters, here uncertain in the sense of fuzzy number. ................................................................. 110

8.2 Hartley-like measure of pollutant concentration along the downwind distance under stability class A. ................................................................. 111
8.3 Hartley-like measure of pollutant concentration along the downwind distance under stability class $D$. ................................................................. 112
8.4 Hartley-like measure of pollutant concentration along the downwind distance under stability class $F$. ................................................................. 113
8.5 Bounds of pollutant concentration taking only wind speed as uncertain under stability class $A$. ................................................................. 114
8.6 Bounds of pollutant concentration taking only wind speed as uncertain under stability class $D$. ................................................................. 115
8.7 Bounds of pollutant concentration taking only wind speed as uncertain under stability class $F$. ................................................................. 115
8.8 Bounds of pollutant concentration taking only discharge velocity as uncertain under stability class $A$. ................................................................. 116
8.9 Bounds of pollutant concentration taking only discharge velocity as uncertain under stability class $D$. ................................................................. 116
8.10 Bounds of pollutant concentration taking only discharge velocity as uncertain under stability class $F$. ................................................................. 117
8.11 Fuzziness measure of pollutant concentration due to wind speed and discharge velocity under stability class $A$. ................................................................. 117
8.12 Fuzziness measure of pollutant concentration due to wind speed and discharge velocity under stability class $D$. ................................................................. 118
8.13 Fuzziness measure of pollutant concentration due to wind speed and discharge velocity under stability class $F$. ................................................................. 118
