List of Tables

2.1 Parametric values in Pasquil-Gifford Model................................. 11

4.1 Information for uncertain parameters [1] under imprecise probability-
               fuzzy uncertainty analysis................................................. 47

4.2 Concentration of ammonia (mg/m$^3$) at core and support for the various
               stability categories........................................................... 48

5.1 Information for uncertain input parameters for the SRSM under possi-
               bilistic and probabilistic inputs......................................... 65

5.2 Coefficients of response polynomial for the various $\alpha$-cuts under the
               stability category B............................................................. 68

5.3 Coefficients of response polynomial for the various $\alpha$-cuts under the
               stability category D............................................................. 68

5.4 Coefficients of response polynomial for the various $\alpha$-cuts under the
               stability category E............................................................. 69

5.5 Coefficients of response polynomial for the various $\alpha$-cuts under the
               stability category F............................................................. 69

5.6 5$^{th}$ and 95$^{th}$ percentile of the ammonia concentration (mg/m$^3$)
               at downwind distance 300 m under the stability category B by
               the SRSM at different $\alpha$-cuts......................................... 69

5.7 5$^{th}$ and 95$^{th}$ percentile of the ammonia concentration (mg/m$^3$)
               at downwind distance 300 m under the stability category D by the
               SRSM at different $\alpha$-cuts................................................. 70

5.8 5$^{th}$ and 95$^{th}$ percentile of the ammonia concentration (mg/m$^3$)
               at downwind distance 300 m under the stability category E by the
               SRSM at different $\alpha$-cuts................................................. 70

5.9 5$^{th}$ and 95$^{th}$ percentile of the ammonia concentration (mg/m$^3$)
               at downwind distance 300 m under the stability category F by the
               SRSM at different $\alpha$-cuts................................................. 70

6.1 Information of the uncertain input parameters............................... 83

6.2 Coefficients of lower and upper response polynomial for different sta-
               bility categories B, C, D and F. The coefficients $a_{l,0}, a_{l,1}, \cdots a_{l,9}$
               are the coefficients of the lower response polynomial and $a_{u,0}, a_{u,1}, \cdots a_{u,9}$
               are the coefficients of the upper response polynomial................. 84
List of Tables

6.3 5th, 50th and 95th percentile of the ammonia concentration (mg/m³) at downwind distance 300 m under the stability categories B, D, E and F by the SRSM and Probability Bounds approach ............................................. 88

7.1 Values of $z_0$ and $u_*$ for use in Average Wind Speed Profile. .............................. 93
7.2 Hartley-like Measure of average wind speed ($\bar{u}$) successively fixing friction velocity $u_*$, von Karman constant $k_a$ and surface roughness length $z_0$. .......................... 93
7.3 Hartley-like Measure of Horizontal Dispersion Co-efficient ($\sigma_{xy}$) successively fixing average wind speed $\bar{u}$, friction velocity $u_*$, heat flux $w_*$ and boundary layer height $h$. ................................................. 98
7.4 Hartley-like Measure of Vertical Dispersion Co-efficient ($\sigma_z$) successively fixing average wind speed $\bar{u}$, friction velocity $u_*$, heat flux $w_*$ and boundary layer height $h$. ......................................................... 99
7.5 Hartley-like Measure of Concentration ($x$) successively fixing average wind speed $\bar{u}$, friction velocity $u_*$, heat flux $w_*$ and boundary layer height $h$. ......................................................... 99

8.1 Triangular fuzzy numbers representing uncertain parameters. ................................. 109
8.2 Crisp Input Values ................................................................................................. 109
