List of Figures

Figure 1: miRNA pathway

Figure 2: Conservation of Dicer across organisms

Figure 3: SILAC mouse – based quantitative proteomic workflow to identify differentially expressed proteins in liver of induced Dicer knockout mice.

Figure 4: Representative MS and MS/MS spectra to depict SILAC ‘spike-in’ strategy for relative quantitation

Figure 5: Microsomal and peroxisomal lipid oxidation pathways

Figure 6: MRM-based validation of upregulation of Peroxidase bifunctional enzyme and Cytochrome p450 3A41 in liver of induced Dicer knockout mice.

Figure 7: Anti-phosphotyrosine blot showing alteration in phosphotyrosine profile of liver of induced Dicer knockout mice (KO) and uninduced dicer knockout mice (Ctrl).

Figure 8: SILAC Spike in strategy for identification of differentially phosphorylated proteins in liver of induced Dicer knockout mice using quantitative proteomics approach

Figure 9: Correlation plot of the peak areas of the ‘heavy’ phosphopeptides identified in common in liver of uninduced and induced Dicer knockout.

Figure 10: Correlation plot of the peak areas of the ‘light’ phosphopeptides identified in common in liver of uninduced and induced Dicer knockout

Figure 11: MS and MS/MS of KLDTGpYYITTR from FGR.
Figure 12: Activation of multiple signaling pathways involved in proliferation and tumorigenesis in liver of induced Dicer knockout mice

Figure 13: MS and MS/MS of DIYETDpYYR from IGF1R/INSR

Figure 14: Activation of INSR/IGF1R signaling in liver of induced Dicer knockout mice
