Preface v

List of Tables xiii

List of Figures xvii

Acronyms xix

1 Overview 1
   1.1 Introduction 3
   1.2 Basic reliability concepts 4
      1.2.1 Reliability function 4
      1.2.2 Hazard function 4
      1.2.3 Mean time to failure 5
      1.2.4 Mean residual life 6
   1.3 Bayesian inference 7
      1.3.1 Likelihood function 8
      1.3.2 Prior probability distributions 8
      1.3.3 Posterior distribution 9
   1.4 Bayes’ theorem 9
   1.5 Types of prior distributions 10
      1.5.1 Informative priors 11
      1.5.2 Weakly informative priors 11
      1.5.3 Least informative priors 12
      1.5.4 Uninformative priors 13
2 Bayesian Reliability Analysis of Exponential Power Model
with Bathtub-shaped Failure Rate

2.1 Introduction ......................................... 49
2.2 Exponential power distribution ....................... 50
  2.2.1 Characterization of failure rate function ....... 51
2.3 Model formulation ...................................
2.4 Independence Metropolis algorithm ................ 54
2.5 Laplace approximation ................................
2.6 R functions for Bayesian computation ............... 56
  2.6.1 The function LaplaceApproximation ............. 56
2.7 Bayes analysis of exponential power model ......... 58
2.8 Analysis of censored data with R .................... 64
2.9 Exponential power regression analysis ............... 70
### Contents

2.9.1  Formulation of the model ........................................... 71
2.10  Determination of burn-in and replacement time ................. 75
2.11  Real data modeling .................................................... 76
  2.11.1 Electronic device failure time data ............................ 76
  2.11.2 Transistor data ................................................... 77
2.12  Conclusion .............................................................. 78

3  Bayesian Analysis of Reliability Improvement Experiments 79
  3.1  Introduction ............................................................ 81
  3.2  Terms and concepts ................................................... 82
  3.3  Reliability experiment with a single factor ....................... 83
  3.4  A Bayesian approach to the analysis and
       model selection for failure time data ............................ 84
    3.4.1 Bayesian analysis of bearing failure times data under
           gamma model ...................................................... 85
    3.4.2 Bayesian analysis of the ball bearing failure times data
           under Weibull model ............................................ 93
    3.4.3 Bayesian analysis of the ball bearing failure times data
           under log-normal model ........................................ 97
  3.5  Model comparison ..................................................... 101
  3.6  Full factorial experiment in reliability .......................... 103
    3.6.1 Factorial analysis: Main Effect and Interaction ............. 105
  3.7  $2^k$ factorial experiment: A general discussion ............... 105
  3.8  Metal alloy crack experiment ..................................... 106
    3.8.1 Bayesian regression approach to the factorial analysis of
           metal alloy crack length data .................................. 107
  3.9  Concluding remarks ................................................ 119

4  Bayesian Hierarchical Modeling of Degradation Data 121
  4.1  Introduction .......................................................... 123
  4.2  General degradation path model .................................... 124
  4.3  Practical motivating situation: Drug potency data ............... 126
    4.3.1 Preliminary exploratory analysis ............................... 127
  4.4  Formulation of hierarchical model ................................ 127
  4.5  Metropolis-within-Gibbs algorithm ................................ 129
  4.6  The function jags ................................................... 130
  4.7  Bayesian analysis of drug potency data ........................... 131
