List of tables

Table 3.1: Chemical composition of JFE-EH400 quenched and tempered low alloy abrasion resistant steel, wt%.................................................................................................................. 89
Table 3.2: Mechanical properties of JFE-EH400 quenched and tempered low alloy abrasion resistant steel ............................................................................................................. 90
Table 3.3: Typical chemical composition of the different filler material electrodes used................................................................................................................................. 90
Table 3.4: Specifications and typical tensile properties of different filler material electrodes used................................................................................................................................. 91
Table 3.5: Filler material combinations used during welding ................................................................................................................................. 95
Table 3.6: Pass wise selection of welding parameters ................................................................. 95
Table 3.7: Filler material combinations used during welding ................................................................. 97
Table 3.8: Pass wise selection of welding parameters for the welded joints ............................ 97
Table 3.9: Etchants used for revealing microstructures of different weldments ..... 103
Table 3.10: Composition of the etchants and etching techniques used in present work ................................................................................................................................. 103
Table 4.1: Factors and levels of independent variables for two-body abrasion wear test (POD) ................................................................................................................................. 134
Table 4.2: Factors and levels of independent variables for three-body abrasion wear test (DSRW) ................................................................................................................................. 135
Table 4.3: Components of CCRD ................................................................................................. 138
Table 4.4: Design matrix for two-body abrasion test in actual form .................................................. 139
Table 4.5: Design matrix for three-body abrasion test in actual form .................................................. 140
Table 4.6: Resulting ANOVA table for response surface quadratic model for two-body abrasion test ................................................................................................................................. 149
Table 4.7: Resulting ANOVA table for response surface quadratic model for three-body abrasion test ................................................................. 150
Table 4.8: Optimization results for two-body abrasion wear test ......................... 154
Table 4.9: Optimization results for three-body abrasion wear test ......................... 154
Table 4.10: Plan of confirmation experiments and results for two-body abrasion test ........................................................................................................ 155
Table 4.11: Plan of confirmation experiments and results for three-body abrasion test........................................................................................................ 155
Table 5.1: Microhardness along different directions of the weldments .............. 196
Table 5.2: Microhardness values along and across WCL of welded joints .......... 197
Table 5.3: Transverse tensile properties of the base metal and the welded joints .... 206
Table 5.4: Tensile properties of the base metal and the welded joints ............... 211
Table 5.5: Impact properties of the base metal and the welded joints ............... 216
Table 5.6: Impact toughness values (at room temperature) and the average microhardness (along M-M direction for 10 mm distance from the surface) of the base metal and the welded joints ........................................ 218
Table 5.7: Impact toughness (at room temperature) and other observations of the base metal and the welded joints impact fractured specimens .......... 228
Table 5.8: Silicon carbide particles size distribution ........................................... 233
Table 5.9: Optimization results for two-body abrasion test (POD) ................. 244
Table 5.10: Optimization results for three-body abrasion test (DSRW) .......... 244
Table 5.11: Pass wise microstructural phases and average microhardness values of the weld metal of the welded joints ........................................ 245
Table 5.12: Results of wear loss of different weldments subjected to two-body abrasion test conditions (Load=20 N, No. of revolutions=300, Abrasive paper=80 mesh) .................................................................246

Table 5.13: Results of three-body abrasion test for different weldments ..................249
