Conclusion
Conclusion

- In chapter 2 we have given estimation of mortality deceleration parameter by pointwise approximation of Logistic Frailty mortality function to Gompertz mortality function. To our knowledge all the available numerical data satisfy the estimation. But the estimation is not sharp in some cases. The areawise approximation is better in such cases.

- The areawise approximation of Logistic Frailty mortality function to Gompertz mortality function allows us to estimate the smallest possible value of mortality deceleration parameter but the pointwise approximation did not allow.

- Life expectancy can be fairly predicted from smallest possible value of mortality deceleration parameter.
