LIST OF TABLES

Table 1.1 Physical properties of LDPE.

Table 4.1 Biochemical characters of the bacterial isolates.

Table 4.2 Organisms identified with BLAST analysis.

Table 4.3 Alignment view and distance matrix table for the c1 isolate.

Table 4.4 Alignment view and distance matrix table for the c2 isolate.

Table 5.1 Component characteristics of LDPE blown film samples used in UV irradiation tests.

Table 5.2 Influence of UV irradiation on work of adhesion of PE and PE with additive.

Table 6.1 Characteristics of LDPE blown film samples used in thermal-oxidation tests.

Table 6.2 Influence of thermo-oxidation in increasing carbonyl index.

Table 6.3 Effect of thermal oxidation on work of adhesion of PE, BPE10 and BPE20.

Table 8.1 TGA data showing percentage weight loss, onset temperature and residual weight of TPE, TBPE10 and TBPE20 samples.

Table 8.2 DSC data showing melting temperature, heat of fusion and percent crystallinity of TPE, TBPE10 and TBPE20 samples.

Table 9.1 Thermal properties of treated and untreated PE incubated with *Lysinibacillus fusiformis* (Lys)

Table 9.2 DSC data showing melting temperature, heat of fusion and percent crystallinity of TPE, TBPE10 and TBPE20 samples.
LIST OF FIGURES

Figure. 1.1 Polyethylene Polymer

Figure 1.2 An overview of polymer degradation

Figure 4.1 Neighbor-joining tree based on 16S rRNA gene sequences, showing phylogenetic relationships between sequences of the Phylum Firmicutes.

Figure 4.2 Neighbor-joining tree based on 16S rRNA gene sequences, showing phylogenetic relationships between sequences of the Phylum Firmicutes and Family Planococcaceae.

Figure 5.1 (a) Production of low density polyethylene film using an extruder & (b) Low density polyethylene prepared as lay flat tube from the die.

Figure 5.2 Sample films of PE, BPE10 and BPE20.

Figure 5.3 (A) Experimental setup of photo-oxidation method for PE and BPE films & (B) Schematic diagram of photo-oxidation method

Figure 5.4 Variation in contact angle of UV treated PE and BPE films as a function of exposure time.

Figure 5.5 Comparative photographs of (A) untreated PE, (B) untreated BPE10 and (C) untreated BPE20 film with (A1) 49 days UV irradiated PE, (B1) 49 days UV irradiated BPE10 and (C1) 49 days UV irradiated BPE20 film showing changes in contact angle.

Figure 5.6 Surface energy variation profile of UV treated PE and BPE films as a function of exposure time.

Figure 5.7 Comparative SEM micrographs showing surface morphology of (A) untreated PE, (B) untreated BPE10 and (C) untreated BPE20 film with (A1) 49 days UV irradiated PE, (B1) 49 days UV irradiated BPE10 and (C1) 49 days UV irradiated BPE20 film.

Figure 5.8 Comparative AFM images showing surface topography of (A) untreated PE, (B) untreated BPE10 and (C) untreated BPE20 film with (A1) 49 days UV irradiated PE, (B1) 49 days UV irradiated BPE10 and (C1) 49 days UV irradiated BPE20 film.

Figure 5.9 Effect of irradiation period on the FTIR spectra of (A) PE, (B) BPE10 and (C) BPE20 film.

Figure 5.10 Variation in tensile strength with UV irradiation.

Figure 5.11 Percentage elongation with UV irradiation

Figure 5.12 Effective of photo-oxidation on PE and the changes in its surface and mechanical properties.

Scheme 5.1 Mechanism of initiation of free radicals in virgin polyethylene during photo-oxidation.
Scheme 5.2 Mechanism of additive (transition metal ions) initiated free radical generation in polyethylene during photo-oxidation.

Scheme 5.3 Formation of ketone by Norrish cleavage mechanism

Scheme 5.4 Norrish type 1 reaction

Scheme 5.5 Norrish type 2 reaction

Figure 6.1 Percentage elongation of PE as a function of time for each material.

Figure 6.2 Tensile strength of PE as a function of time for each material.

Figure 6.3 FTIR spectra of (a) PE, (b) BPE10 and (c) BPE20 as a function of thermal exposure period.

Figure 6.4 Comparative photographs with chart of changes in contact angle during thermo-oxidation (i) PE, (ii) BPE10 and (iii) BPE20 film as a function of various thermal exposure period.

Figure 6.5 Surface energy variation profiles of thermally oxidised PE and BPE films as a function of exposure time.

Figure 6.6 Comparative SEM micrographs showing surface morphology of (A) untreated PE, (B) untreated BPE10 and (C) untreated BPE20 film with 35 days thermo-oxidised PE (A1), BPE10 (B1) and BPE20 film (C1).

Figure 6.7 Comparative AFM images showing surface topography of untreated PE (A), BPE10 (B) and BPE20 (C) film with 35 days thermo-oxidised PE (A1), BPE10 (B1) and BPE20 film (C1).

Figure 6.8 Effective of thermo-oxidation on PE and the changes in its surface and mechanical properties.
