List of Figures

Chapter 1
1.1 2D Structure of Rotavirus. 6

Chapter 2
2.1 Electron micrograph of rotavirus particles from the filtrate of a stool collected from a child with acute gastroenteritis. 70-nm particles possess distinctive double-shelled outer capsid. Bar = 100 nm. 8
2.2 Schematic diagram depicting rotavirus structure. 8
2.3 Electrophoretic migration of Rotavirus ds RNA depicting (a) Long and Short Pattern (b) Mixed infection 10
2.4 Route of rotavirus entry. 19
2.5 Rotavirus Pathogenesis 22
2.6 Infections causing gastroenteritis in the developed and developing world. 24

Chapter 4
4.1 Age distribution of rotavirus positivity among adolescent and adult cases of acute gastroenteritis in 1993 -1996 and 2004 –2007. 78
4.5 Yearly distribution of rotavirus P-types detected in xxii

4.6 Electrophoretic migration pattern of rotavirus multiplex PCR products visualized on agarose gel.

Chapter 5

5.1 Electrophoretic migration pattern of group A and group B rotavirus dsRNA from ELISA negative stool specimens.

5.2 Phylogenetic tree based on partial nucleotide sequences of group B rotavirus gene 4 (nt 33-393). The strains of the present study (in blue) and reference strains (in red, published by Chitambar et al., 2011) are identified by the specimen number.

5.3 Phylogenetic tree based on partial nucleotide sequences of group B rotavirus gene 6 (nt 31-660). The strains of the present study (in blue) and reference strains (in red, published by Chitambar et al., 2011) are identified by the specimen number.

5.4 Phylogenetic tree based on partial nucleotide sequences of group B rotavirus gene 9 (nt 31-747). The strains of the present study (in blue) and reference strains (in red, published by Chitambar et al., 2011) are identified by the specimen number.

Chapter 6

6.1a Phylogenetic tree based on the partial nucleotide sequences of the VP7 (G1) gene (nt 352-900) of rotavirus strains recovered from adolescents and adults in 1993-1996 and 2004-2007. The strains of the present study are identified by the specimen number, followed by the genotypes identified in multiplex PCR. The reference strains are indicated by accession numbers followed by
List of Figures

the strain names. I to XI denote lineages for G1 genotype.

6.1b Multiple alignment of the deduced amino acid positions of VP7 protein of G1 rotavirus strains with prototype strain at two time points (1993-1996 and 2004-2007). Dots indicate identity with the prototype strain.

6.2a Phylogenetic tree based on the partial nucleotide sequences of the VP7 (G2) gene (nt 448-894) of rotavirus strains recovered from adolescents and adults in 1993-1996 and 2004-2007. The strains of the present study are identified by the specimen number, followed by the genotypes identified in multiplex PCR. The reference strains are indicated by accession numbers followed by the strain names. I to IV denote lineages for G2 genotype.

6.2b Multiple alignment of the deduced amino acid positions of VP7 protein of G2 rotavirus strains with prototype strain at two time points (1993-1996 and 2004-2007). Dots indicate identity with the prototype strain.

6.3a Phylogenetic tree based on the partial nucleotide sequences of the VP7 (G3) gene (nt 280-900) of rotavirus strains recovered from adolescents and adults in 1993-1996 and 2004-2007. The strains of the present study are identified by the specimen number, followed by the genotypes identified in multiplex PCR. The reference strains are indicated by accession numbers followed by the strain names.

6.3b Multiple alignment of the deduced amino acid positions of VP7 protein of G3 rotavirus strains with prototype strain at two time points (1993-1996 and 2004-2007). Dots indicate identity with the prototype strain.
6.4a Phylogenetic tree based on the partial nucleotide sequences of the VP7 (G4) gene (nt 466-855) of rotavirus strains recovered from adolescents and adults in 1993-1996 and 2004-2007. The strains of the present study are identified by the specimen number, followed by the genotypes identified in multiplex PCR. The reference strains are indicated by accession numbers followed by the strain names.

6.4b Multiple alignment of the deduced amino acid positions of VP7 protein of G4 rotavirus strains with prototype strain at two time points (1993-1996 and 2004-2007). Dots indicate identity with the prototype strain.

6.5 Phylogenetic tree based on the partial nucleotide sequences of the VP7 (G9) gene (nt 751-907) of rotavirus strains recovered from adolescents and adults in 1993-1996 and 2004-2007. The strains of the present study are identified by the specimen number, followed by the genotypes identified in multiplex PCR. The reference strains are indicated by accession numbers followed by the strain names. L1 to L6 denote lineages for G9 genotype.

Chapter 7

7.1 Phylogenetic tree based on the partial nucleotide sequences of the VP4 (P[4]) gene (nt 43-456) of rotavirus strains recovered from adolescents and adults in 1993-1996 and 2004-2007. The strains of the present study are identified by the specimen number, followed by the genotypes identified in multiplex PCR. The reference strains are indicated by accession numbers followed by the strain names. P[4]-1 to P[4]-5 denote lineages of P[4]
List of Figures

7.3 Phylogenetic tree based on the partial nucleotide sequences of the VP4 (P[8]) gene (nt 40-321) of rotavirus strains recovered from adolescents and adults in 1993-1996 and 2004-2007. The strains of the present study are identified by the specimen number, followed by the genotypes identified in multiplex PCR. The reference strains are indicated by accession numbers followed by the strain names. P[8]-1 to P[8]-4 denote lineages of P[8] genotype.

7.5 Phylogenetic tree based on the partial nucleotide sequences of the VP4 (P[6]) gene (nt 40-249) of rotavirus strains recovered from adolescents and adults in 1993-1996 and 2004-2007. The strains of the present study are identified by the specimen number, followed by the genotypes identified in multiplex PCR. The reference strains are indicated by accession numbers followed by the strain names. P[6]-I to P[6]-V denote lineages of P[6] genotype.

Chapter 8

8.1a Phylogenetic tree based on partial nucleotide sequences (subgrouping region) of the VP6 gene (nt 780-1100) of
rotavirus strains recovered from adolescents and adults in 1993-1996. The strains of the present study are identified by the specimen number, followed by the genotypes identified in multiplex PCR. The prototype strains are indicated by the accession number followed by the strain names. I-1 to I-2 and II-1 to II-4 denote lineages of VP6 genogroups I and II respectively. NT-Non-typeable.

8.1b Phylogenetic tree based on partial nucleotide sequences (subgrouping region) of the VP6 gene (nt 780-1100) of rotavirus strains recovered from adolescents and adults in 2004-2007. The strains of the present study are identified by the specimen number, followed by the genotypes identified in multiplex PCR. The prototype strains are indicated by the accession number followed by the strain names. I-1 to I-2 and II-1 to II-4 denote lineages of VP6 genogroups I and II respectively. NT-Non-typeable.

8.2a Multiple alignment of the deduced amino acid residues of the subgrouping region of human rotavirus VP6 proteins with GG I and II specificities (1993-1996). Dots indicate identity with the prototype strain. GG indicates genogroup.

8.2b Multiple alignment of the deduced amino acid residues of the subgrouping region of human rotavirus VP6 proteins with GG I and II specificities (2004-2007). Dots indicate identity with the prototype strain. GG indicates genogroup.
List of Figures

8.3a Phylogenetic tree based on the nucleotide sequences of NSP4 gene (nt 42–569) of rotavirus strains recovered from adolescents and adults in 1993-1996. The strains of the present study are identified by the specimen number, followed by the genotypes identified in multiplex PCR. The prototype strains are indicated by the accession number followed by the strain names. A-l and B-l denote lineages of NSP4 genotype A and NSP4 genotype B respectively. NT-Non-typeable.

8.3b Phylogenetic tree based on the nucleotide sequences of NSP4 gene (nt 42-569) of rotavirus strains recovered from adolescents and adults in 2004-2007. The strains of the present study are identified by the specimen number, followed by the genotypes identified in multiplex PCR. The prototype strains are indicated by the accession number followed by the strain names. A-l and B-l denote lineages of NSP4 genotype A and NSP4 genotype B respectively. NT-Non-typeable.
