

PREFACE

Tools for the measurement of intelligence and social maturity are available in plenty in the western countries. This is, however, not the case in India. The tests available here are not only few but very old, too. Hence, before pursuing any kind of study of mental retardation, well-standardized tools to enable the identification and classification of the mentally retarded are essential. In view of this, the present research entailed the standardization of tools to assess intelligence and social maturity.

It is with great pleasure that I extend my gratitude to the many who have contributed in the completion of this piece of research. I wish to express my sincere gratitude to my Guide-in-research, Dr. M.N. Palsane, whose unfailing patience and guidance through the years has been of unfathomable importance to me. My thanks to the staff and colleagues of the Department of Experimental Psychology, Poona University, for their constant encouragement in the form of enquiry of progress. To the principals, teachers and students of the various schools in Poona, I give a special thanks for their immense cooperation and interest. The schools for the mentally retarded children, Poona and Bombay, have a large share in my gratitude. I wish to particularly thank Mrs. U.V. Shintre, an efficient psychiatric social worker in one of these schools, without

whose interest and help I would not have completed this thesis yet. The Jayakar library and its staff cannot be forgotten, and I thank them for their help. My many thanks to all my friends whose interest in my research was a great encouragement. My gratitude to my parents and family for their interminable gentleness and encouragement towards completion of the research is inexplicable. I wish to very sincerely thank the University of Poona for the award of the research stipend and the U.G.C. for their financial assistance to see this project through. I also thank Mrs. P.P. Paranjpe for typing this thesis.

Poona.

1978.
