4.22 Significance of Difference between the Adjusted Means for both the Control Group and the Experimental Group-II 209

4.23 Significance of Difference of Adjusted Means for CAI and Traditional Method for High Intelligence Group 212

4.24 Significance of Difference of Adjusted Means for CAI and Traditional Method for Average Intelligence Group 215

4.25 Significance of Difference of Adjusted Means for CAI and Traditional Method for Low Intelligence Group 218

4.26 Significance of Difference of Adjusted Means for CL and Traditional Method for High Intelligence Group 221

4.27 Significance of Difference of Adjusted Means for CL and Traditional Method for Average Intelligence Group 224

4.28 Significance of Difference between the Adjusted Delayed Post-test Scores of the Control Group and the Experimental Group-I 227

4.29 Significance of Difference between the Adjusted Delayed Post-test Scores of the Control Group and the Experimental Group-II 230

LIST OF FIGURES
3.1 Diagrammatic Representation of Jigsaw Method

4.1 Significance of Difference between the Scores of CAI and Traditional Method at Post-test Level for Total Sample

4.2 Significance of Achievement Scores under CL and Traditional Method at Post-test Level for Total Sample

4.3 Significance of Difference between the Achievement Scores of CAI and Traditional Method at Post-test Level with regard to the Level of Intelligence

4.4 Significance of Difference between the Achievement Scores of CL and Traditional Method at Post-test Level with regard to the Level of intelligence

4.5 Significance of Difference between the Pre-test and the Post-test Scores of the Experimental Group-I

4.6 Significance of Difference between the Pre-test and the Post-test Scores of the Experimental Group-II

4.7 Significance of Difference between the Control and the Experimental Group-I in the Overall Scores of Delayed Post-test

4.8 Significance of Difference between the Control and the Experimental Group-II in the Overall Scores of Delayed Post-test
4.9 Significance of Difference between the Control and the Experimental Group-I in the Scores of Delayed Post-test with regard to the Level of Intelligence

4.10 Significance of Difference between the Control and the Experimental Group-II in the Scores of Delayed Post-test with regard to the Level of Intelligence

4.11 Significance of Difference between the Adjusted Post-test Scores of the Control Group and the Experimental Group-I

4.12 Significance of Difference between the Adjusted Post-test Scores of the Control Group and the Experimental Group-II

4.13 Significance of Difference of Adjusted Means for CAI and Traditional Method for High Intelligence Group

4.14 Significance of Difference of Adjusted Means for CAI and Traditional Method for Average Intelligence Group

4.15 Significance of Difference of Adjusted Means for CAI and Traditional Method for Low Intelligence Group

4.16 Significance of Difference of Adjusted Means for CL and Traditional Method for High Intelligence Group

4.17 Significance of Difference of Adjusted Means for CL and Traditional Method for Average Intelligence Group

4.18 Significance of Difference between the Adjusted Delayed Post-test Scores of the Control Group and the Experimental Group-I

4.19 Significance of Difference between the Adjusted Delayed Post-test Scores of the Control Group and the Experimental Group-II
