AIMS
&
OBJECTIVES
AIMS AND OBJECTIVES

Study aimed at categorization of patients into contact and study groups followed by general, systemic and local examination and relevant investigations.

- Then measurements of serum magnesium levels in normal pregnancy cases and high risk cases including threatened abortion, preterm labour and pregnancy induced hypertension cases.
- Comparative evaluation of these levels and setting up a relationship of the values.
- Predicting its effect on pregnancy outcome and correcting it by magnesium supplementations.

OBJECTIVES

The final objectives of the study were :-

- To detect high risk pregnancy cases by estimation of lowered values of serum magnesium levels.
- Followed by their management at earliest and trial of improvement by oral magnesium supplementation.
- To improve pregnancy outcome and fetal prognosis.
