CHAPTER 7

LIMITATIONS
LIMITATION OF THE STUDY

(1) This evaluation is based on the primary data generated through questionnaire and personal interview collected from the Doctors and Patients as such their finding depends entirely on the accuracy of such data.

(2) The study concentrates on both views of Doctors and patients and about Primary health centers and its services. The major tool, which is used for evaluation, is 7-point scale known as likert scale and it has its own limitation.

(3) Different experts have got different views on evaluating the services provided by Primary Health Centers hence the view used in the study for the present purpose can not be treated as the absolute and perfect.

(4) As the information is generated through questionnaire and that too generated as the top of the mind information hence data has element of personal bias of the Doctors and Patients answering questions.

(5) Researcher being outside, external analyst obviously have no access to the internal information. Therefore it is hard to characterize inside view of the hospital in the study.
