INTRODUCTION	1
OBJECT OF PRESENT STUDY	21
MATERIAL AND METHODS	26
 EXPERIMENTAL RESULTS	
I. Experiments to prove the host specificity of non-susceptible control bird chick to <u>Plasmodium (Garnhamella) coturnixae</u>	50
II. Malaria parasite in cell free preparation	52
III. Quantitative and qualitative estimation of hemoglobin in susceptible and non- susceptible birds	56
IV. Composition of the serum in susceptible and non-susceptible birds	64
V. Experiments on the immunological aspects of host specificity	71
VI. Experiments on the specific attachment of the parasite just before penetration on the cell membrane of susceptible erythrocyte	74
VII. Parasite inoculation in chick embryo	76
 DISCUSSION	
1. Host specificity of this malaria parasite <u>P. (Garnhamella) coturnixae</u>	77

	<u>Page</u>
2. Hemoglobin	80
3. Serum sodium and potassium	84
4. The role of host gamma globulin in the develop- ment of malaria parasite	85
5. Occurrence of naturally occurring antibodies in the resistant birds	88
6. The role of erythrocyte surface membrane in determining the host specificity of malaria parasite	89
7. Non-susceptibility of chick embryo	92
8. Conclusion	95
