## LIST OF TABLES

1.1 High temperature thermoplastics used in fibre reinforced plastics ....... 9
1.2 Engineering and commodity thermoplastics used in fibre reinforced plastics .................................. 10
1.3 List of commercial immiscible blends ........................................ 22
2.1 Properties of polypropylene ......................................................... 102
2.2 Properties of LDPE ................................................................. 103
2.3 Properties of PET ................................................................. 103
2.4 Properties of compatibilizer ....................................................... 104
4.1 Static mechanical properties of PP, PET, neat blend and MFCs ...... 145
4.2 Experimental and theoretical tensile strength, tensile modulus values obtained for in-situ composites ........................................ 155
5.1 Values of tan δ maximum, E”maximum and T_{g} values from tan δ and E” plots for PP, neat blend and MFCs prepared at draw ratios 2, 5, 8, 10 .......................................................... 177
5.2 Experimental and theoretical storage moduli for the in-situ composites at 30°C and 50°C determined at 1 Hz ......................... 179
6.1 Thermal properties of PP phase in neat PP, neat blend(NB), microfibrillar blend and microfibrillar composites obtained from DSC studies ............................................................................... 191
6.2 Thermal properties of PP phase in neat PP, as extruded blend, stretched blend and MFC prepared at draw ratio 5 ....................... 199
7.1 Non-isothermal decomposition characteristics of PP, PET, NB, microfibrillar blends and microfibrillar composites in nitrogen .... 219
7.2 Activation energy for PP, PET, neat blend, microfibrillar blends and composites ................................................................. 227
8.1 Average, maximum and minimum diameters of PET spheres/fibres .................................................................................. 239
9.1 Tensile properties of normal blends and MFCs based on LDPE / PET .................................................................................. 248
9.2 Experimental and theoretical storage moduli for the LDPE/PET microfibrillar composites at 0°C and -30°C determined at 10 Hz ..... 267
10.1 Tensile properties of compatibilized normal blends and MFCs prepared from LDPE/PET ................................................................. 285
10.2 Tensile and impact properties of LDPE/PET blends and microfibrillar composites prepared at 75/25 and 85/15 w/w% with 4 wt% compatibilizer ................................................................. 295
10.3 Activation energy for glass transition for blends and MFCs ........... 309
11.1 Diffusion, Sorption, Permeability coefficients of LDPE, normal blends and microfibrillar composites at 30°C ........................................ 321
11.2 Diffusion, Sorption, Permeability coefficients of LDPE, normal blends and microfibrillar composites at 50°C ................................. 326
11.3 Diffusion, Sorption, Permeability coefficients of LDPE, normal blends and microfibrillar composites at 70°C ................................. 329
11.4 n and k values for diffusion of xylene through LDPE, normal blends and MFCs ................................................................. 331
11.5 Non-isothermal decomposition characteristics of LDPE, PET, strands of normal blends, microfibrillar blends in nitrogen ............ 335
11.6 Activation energy for degradation for LDPE, PET, NS85, NS75, MS85 and MS75 ................................................................. 340
