Future Plan Of Work
1. To elucidate and explore other possible antidiabetic effects of vanadate on pathological conditions related with diabetes such as retinopathy, neuropathy etc.

2. To study and elucidate the mechanism of action of vanadate at cellular and molecular level for its insulin-like antidiabetic properties.

3. To explore the formation of vanadium complexes that can be orally administered at a lower concentration than vanadate to elicit a more effective response.

4. To study the possible beneficial effects of coadministration of antioxidants like flavanoids along with vanadate.
