List of Tables

Table - 1 : Serum level (Mean ± SEM) and level of significance of T₃ (µg/ml) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from root of Satavari (Asparagus racemosus)

Table - 2 : Serum level (Mean ± SEM) and level of significance of T₄ (µg/100 ml) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from root of Satavari (Asparagus racemosus)

Table - 3 : Serum level (Mean ± SEM) and level of significance of TSH (µIU/ml) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from root of Satavari (Asparagus racemosus)

Table - 4 : Serum level (Mean ± SEM) and level of significance of FSH (IU/L) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from root of Satavari (Asparagus racemosus)

Table - 5 : Serum level (Mean ± SEM) and level of significance of LH (IU/L) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from root of Satavari (Asparagus racemosus)

Table - 6 : Serum level (Mean ± SEM) and level of significance of Testosterone (ng/ml) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from root of Satavari (Asparagus racemosus)

Table - 7 : Serum level (Mean ± SEM) and level of significance of Triglyceride (mg/100 ml) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from root of Satavari (Asparagus racemosus)
Table 8: Serum level (Mean ± SEM) and level of significance of Cholesterol (mg/100 ml) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from root of Satavari (Asparagus racemosus).

Table 9: Serum level (Mean ± SEM) and level of significance of HDL (mg/100 ml) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from root of Satavari (Asparagus racemosus).

Table 10: Serum level (Mean ± SEM) and level of significance of Creatinine (mg/100 ml) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from root of Satavari (Asparagus racemosus).

Table 11: Serum level (Mean ± SEM) and level of significance of Spermine (nmol/ml) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from root of Satavari (Asparagus racemosus).

Table 12: Serum level (Mean ± SEM) and level of significance of Spermidine (nmol/ml) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from root of Satavari (Asparagus racemosus).

Table 13: Serum level (Mean ± SEM) and level of significance of Putrescine (nmol/ml) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from root of Satavari (Asparagus racemosus).

Table 14: Serum level (Mean ± SEM) and level of significance of Cadaverine (nmol/ml) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from root of Satavari (Asparagus racemosus).

Table 15: Serum level (Mean ± SEM) and level of significance of T3 (µg/ml) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from seeds of Alkushi (Mucuna pruriens).
Table – 16: Serum level (Mean ± SEM) and level of significance of T4 (μg/100 ml) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from seeds of Alkushi (Mucuna pruriens)

Table – 17: Serum level (Mean ± SEM) and level of significance of TSH (μIU/ml) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from seeds of Alkushi (Mucuna pruriens)

Table – 18: Serum level (Mean ± SEM) and level of significance of FSH (IU/L) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from seeds of Alkushi (Mucuna pruriens)

Table – 19: Serum level (Mean ± SEM) and level of significance of LH (IU/L) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from seeds of Alkushi (Mucuna pruriens)

Table – 20: Serum level (Mean ± SEM) and level of significance of Testosterone (ng/ml) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from seeds of Alkushi (Mucuna pruriens)

Table – 21: Serum level (Mean ± SEM) and level of significance of Triglyceride (mg/100 ml) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from seeds of Alkushi (Mucuna pruriens)

Table – 22: Serum level (Mean ± SEM) and level of significance of Cholesterol (mg/100 ml) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from seeds of Alkushi (Mucuna pruriens)

Table – 23: Serum level (Mean ± SEM) and level of significance of HDL (mg/100 ml) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from seeds of Alkushi (Mucuna pruriens)
Table 24: Serum level (Mean ± SEM) and level of significance of Creatinine (mg/100 ml) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from seeds of Alkushi (Mucuna pruriens).

Table 25: Serum level (Mean ± SEM) and level of significance of Spermine (nmol/ml) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from seeds of Alkushi (Mucuna pruriens).

Table 26: Serum level (Mean ± SEM) and level of significance of Spermidine (nmol/ml) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from seeds of Alkushi (Mucuna pruriens).

Table 27: Serum level (Mean ± SEM) and level of significance of Putrescine (nmol/ml) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from seeds of Alkushi (Mucuna pruriens).

Table 28: Serum level (Mean ± SEM) and level of significance of Cadaverine (nmol/ml) hormone in male individuals with two age groups (40-59 years and 60-75 years) treated with extracts from seeds of Alkushi (Mucuna pruriens).
