CHAPTER 2
MOLECULAR IMPRINTED POLYMERS: A RETROSPECT
2.1 Introduction .................................................................................................. 11
2.2 Principle of molecular imprinting ................................................................. 13
2.3 Different parameters involved in the tailoring of molecular
imprinted polymer ............................................................................................. 14
  2.3.1 Template ................................................................................................. 14
  2.3.2 Functional monomers ............................................................................. 15
  2.3.3 Crosslinkers ........................................................................................... 17
  2.3.4 Porogens ................................................................................................ 18
  2.3.5 Initiators ................................................................................................ 19
2.4 The different stages involved in the preparation of the imprinted
polymers .......................................................................................................... 20
  2.4.1 Preorganisation stage ............................................................................... 20
    a) Covalent interactions .............................................................................. 21
    b) Non-covalent interactions ...................................................................... 21
    c) Covalent plus non-covalent interactions .............................................. 23
  2.4.2 Crosslinking of the monomer around the complex ................................ 23
  2.4.3 Shaping the molecular imprinted polymers .......................................... 24
  2.4.4 Template molecule extraction stage .................................................... 27
  2.4.5 Influence of the solvent ........................................................................ 28
2.5 Recognition properties: Guest capacity ..................................................... 29
2.6 Specificity of recognition ............................................................................ 30
2.7 Polymer characterization ............................................................................. 32
  2.7.1 Chemical characterization ..................................................................... 32
    a) Elemental micro-analysis ....................................................................... 32
    b) Fourier-transform infra-red spectroscopy (FTIR) .................................. 33
    c) Solid-state NMR .................................................................................... 33
  2.7.2 Morphological characterization ............................................................ 33
    a) Solvent uptake experiments ................................................................... 34
    b) Nitrogen sorption porosimetry ............................................................... 34
Applications of imprinted polymers .................................................. 35
2.8.1 Separation ............................................................................. 36
    a) Chromatography ................................................................. 36
    b) Capillary Electrophoresis ..................................................... 37
    c) Solid Phase Extraction ......................................................... 37
2.8.2 Binding assays ...................................................................... 38
2.8.3 Sensors .................................................................................. 39
2.8.4 Catalysis ................................................................................. 41
2.8.5 Imprinting with a transition state analogue (TSA) of the ester hydrolysis ................................................................. 43
    a) Metal-coordination ............................................................... 43
    b) Non-covalent interaction ....................................................... 46
    c) Covalent interaction ............................................................ 48
    d) Stoichiometric non-covalent interaction ............................... 50
2.8.6 Catalysis of elimination reactions ........................................... 52
2.8.7 Catalysis of carbon-carbon bond formation ........................... 54
2.8.8 Catalysis of oxidation and hydrogen transfer ......................... 56

References ....................................................................................... 58

CHAPTER 3
RESULTS AND DISCUSSION
Synthesis, Characterisation and Catalytic Studies of Transition State Analogue Imprinted and Non-imprinted Polymers
3.1 EGDMA-crosslinked TSA imprinted and non-imprinted polymers: Synthesis, characterization and catalytic studies .......... 73
3.1.1 Synthesis of transition state analogue (phenyl 1-benzyloxy carbonylamino-4-methoxybenzyl phosphonate) .................. 73
3.1.2 Synthesis of monomer (N-methacyrloyl L-histidine) .......... 73
3.1.3 Synthesis of TSA imprinted and non-imprinted polymers .... 74
3.1.4 Characterisation of transition state analogue ....................... 75
    a) FT-IR .................................................................................. 75
    b) $^1$H NMR .......................................................................... 75
    c) $^{31}$P NMR ......................................................................... 76
3.1.5 Characterisation of N-methacyrloyl L-histidine ................. 76
3.1 Characterisation of TSA imprinted and non-imprinted polymers

3.1.6 Characterisation of TSA imprinted and non-imprinted polymers...

3.1.7 Swelling studies

3.1.8 Catalytic hydrolysis of various esters by TSA imprinted and non-imprinted polymers...

3.1.9 Evaluation of the rate of catalytic hydrolysis

3.1.10 Catalytic activities of imprinted and non-imprinted polymers

3.1.11 Substrate selectivity of TSA imprinted polymer

3.1.12 Enantioselectivity of TSA imprinted polymer

3.1.13 Optimisation of conditions of catalytic hydrolysis

3.2 EGDMA-crosslinked TSA imprinted and non-imprinted polymers in chloroform: Synthesis, characterization and catalytic studies

3.2.1 Synthesis of TSA imprinted and non-imprinted polymers

3.2.2 Spectral analysis of TSA imprinted and non-imprinted polymers

3.2.3 Morphological studies

3.2.4 Swelling studies

3.2.5 Catalytic activities of imprinted and non-imprinted polymers

3.2.6 Substrate selectivity of TSA imprinted polymer

3.2.7 Enantioselectivity of TSA imprinted polymer

3.2.8 Optimisation of conditions of catalytic hydrolysis

3.3 DVB-crosslinked TSA imprinted and non-imprinted polymers:

Synthesis, characterization and catalytic studies
3.3.1 Synthesis of DVB-crosslinked TSA imprinted and non-imprinted polymers .................................................. 102
3.3.2 Spectral analysis of DVB-crosslinked TSA imprinted polymer ............................................................................... 103
3.3.3 Morphological studies ............................................................................................................................................ 104
3.3.4 Swelling studies ...................................................................................................................................................... 104
3.3.5 Catalytic activities of DVB-crosslinked TSA imprinted and non-imprinted polymers ........................................... 105
3.3.6 Substrate selectivity of TSA imprinted polymer ................. 107
3.3.7 Enantioselectivity of TSA imprinted polymer ................. 108
3.3.8 Optimisation of conditions of catalytic hydrolysis .............. 109
  a) Effect of substrate concentration ............................................. 109
  b) Effect of pH on catalytic hydrolysis ........................................ 110
  c) Rate of hydrolysis and solvent effect ........................................ 111

3.4 EGDMA-crosslinked imprinted and non-imprinted N-methacyrloyl L-histidine and methacrylic acid copolymers: Synthesis, characterization and catalytic studies ..................... 112
3.4.1 Synthesis of EGDMA-crosslinked TSA imprinted and non-imprinted copolymers .................................................... 113
3.4.2 Spectral analysis of TSA imprinted and non-imprinted copolymers ........................................................................... 114
3.4.3 Morphological studies ............................................................ 115
3.4.4 Swelling studies ...................................................................................................................................................... 116
3.4.5 Catalytic activity of imprinted and non-imprinted copolymers ................................................................................... 117
3.4.6 Substrate selectivity of TSA imprinted polymer ................. 118
3.4.7 Enantioselectivity of TSA imprinted polymer ................. 119
3.4.8 Optimisation of conditions of catalytic hydrolysis .............. 120
  a) Effect of substrate concentration ............................................. 120
  b) Effect of pH on catalytic hydrolysis ........................................ 121
  c) Rate of hydrolysis and solvent effect ........................................ 122

3.5 DVB-crosslinked imprinted and non-imprinted N-methacyrloyl L-histidine and methacrylic acid copolymers: Synthesis, characterization and catalytic studies ................................................. 123
3.5.1 Synthesis of DVB-crosslinked TSA imprinted MAA and MA-His copolymers .............................................................. 124
3.5.2 Spectral analysis of TSA imprinted and non-imprinted copolymers ............................................................... 124
3.5.3 Morphological studies ............................................................ 125
3.5.4 Swelling studies ................................................................. 125
3.5.5 Catalytic activities of imprinted and non-imprinted copolymers ......................................................... 126
3.5.6 Substrate selectivity of TSA imprinted polymer ............... 127
3.5.7 Enantioselectivity of TSA imprinted polymer ................. 129
3.5.8 Optimisation of conditions of catalytic hydrolysis .......... 130
   a) Effect of substrate concentration .................................. 130
   b) Effect of pH on catalytic hydrolysis .............................. 131
   c) Rate of hydrolysis and solvent effect .......................... 132
3.6 Co(II) ion coordinated TSA imprinted and non-imprinted polymers: Synthesis, characterization and catalytic studies ............ 133
3.6.1 Synthesis of TSA imprinted and non-imprinted polymers with Co(II) ion coordination centres ......................... 134
3.6.2 Spectral analysis of TSA imprinted and non-imprinted copolymers .............................................................. 134
3.6.3 Morphological studies .................................................. 135
3.6.4 Swelling studies .......................................................... 135
3.6.5 Catalytic activities of imprinted and non-imprinted copolymers ................................................................. 136
3.6.6 Substrate selectivity of TSA imprinted polymer ............... 137
3.6.7 Enantioselectivity of TSA imprinted polymer ................. 139
3.6.8 Optimisation of conditions of catalytic hydrolysis .......... 139
   a) Effect of substrate concentration .................................. 140
   b) Effect of pH on catalytic hydrolysis .............................. 140
   c) Rate of hydrolysis and solvent effect .......................... 141
References ........................................................................... 144

CHAPTER 4
EXPERIMENTAL
4.1 Materials ........................................................................ 147
4.2 Instrumentation and analysis ............................................ 147
4.3 Preparation of N-protected phenylalanine esters .................. 148
  4.3.1 Preparation of p-nitrophenyl Z-L(D)-phenylalanine ......... 149
  4.3.2 Preparation of p-nitrophenyl t-Boc-L-phenylalanine ...... 149
  4.3.3 Preparation of p-nitrophenyl N-Phth-L-phenylalanine .... 149
4.4 Synthesis of transition state analogue (phenyl 1-benzylxoycarbonylamino-4-methoxybenzyl phosphonate) ........ 149
4.5 Monomer preparation ...................................................... 150
4.5.1 Preparation of methacryloyl chloride ................................................. 150
4.5.2 Synthesis of N-methacryloyl L-histidine ............................................ 150
4.6 Synthesis of TSA imprinted and non-imprinted polymers .................... 151
  4.6.1 Synthesis of EGDMA-crosslinked TSA imprinted and non-imprinted polymers .......................................................... 151
  4.6.2 Estimation of total amino acid in MIP and NIP ................................ 152
4.7 Synthesis of EGDMA-crosslinked TSA imprinted and non-imprinted polymers in chloroform ................................................. 153
4.8 Synthesis of DVB-crosslinked TSA imprinted and non-imprinted polymers .......................................................... 153
4.9 Synthesis of EGDMA-crosslinked MA-His-co-MAA polymers ............ 154
4.10 Synthesis of DVB-crosslinked MA-His-co-MAA polymers ............ 155
4.11 Synthesis of Co(II) coordinated EGDMA-crosslinked TSA imprinted polymers .......................................................... 156
4.12 Swelling studies of the imprinted and non-imprinted polymers ........ 157
4.13 Catalytic hydrolysis of esters by TSA imprinted and non-imprinted polymers .......................................................... 157
4.14 Dependence of various parameters on the catalytic hydrolysis of esters .......................................................... 158
  4.15.1 Effect of substrate concentration ................................................. 158
  4.15.2 Effect of pH .......................................................... 158
  4.15.3 Effect of solvent .......................................................... 159
  4.15.4 Extent of crosslinking .......................................................... 159
4.16 Substrate specificity of TSA imprinted polymer .............................. 159
4.17 Enantioselectivity of TSA imprinted polymer ................................ 159
  References ........................................................................ 160
