LIST OF TABLES

Title

Table 1.1  Features of innate and adaptive immunity
Table 1.2  Functions of antibody isotypes
Table 2.1  List of important databases
Table 2.2  Online servers for prediction of subcellular localization
Table 2.3  T-cell related immunological databases
Table 2.4  Web servers for prediction of MHC-binding peptides, T-cell epitopes and proteasome cleavage sites
Table 2.5  Work done in predicting B-cell epitopes in chronological order
Table 3.1  Command-line options used in BLAST
Table 3.2  Command-line options used in PSI-BLAST
Table 3.3  Command line options used in MEME/MAST motif search
Table 3.4  Physico-chemical properties based methods used in the study of B-cell epitopes
Table 3.5  Different kernel options in SVM
Table 3.6  List of different types of options available in SVM
Table 3.7  The different parameters used in FNN and RNN
Table 3.8  Binary or sparse encoding of amino acids
Table 4.1  The performance of various modules including SVM modules based on various features of protein sequence and PSI-BLAST
Table 4.2  Summary of the individual entries based on Swiss-Prot accession number
Table 4.3  The P-value of amino acid residues of the composition analysis of bacterial toxin and nontoxin protein sequences
Table 4.4  The P-value of amino acid residues of the compositional analysis of exotoxin and endotoxin protein sequences
Table 4.5  Various parameters were used to check the performance of the SVM module based on amino acid composition to classify bacterial toxins
Table 4.6  The performance of various SVM modules on classification of bacterial toxins using features such as amino acid and dipeptide composition, at threshold 0.1 and PSI-BLAST
Various parameters were used to check the performance of the SVM module based on amino composition to classify types of bacterial toxins, exotoxin and endotoxin

The performance of various SVM modules on classification of types of bacterial toxins (Exotoxins or endotoxins) using features such as amino acid, dipeptide composition at threshold 0.000 and PSI-BLAST

The performance of HMM and PSI-BLAST at E-value=.01 for classification of exotoxins based on function

Distribution of neurotoxins showing source and functions obtained from Swiss-Prot

The P-value of amino acid residues of the compositional analysis of neurotoxins and nontoxin protein sequences

The performance of FNN on classifying neurotoxin sequences and nontoxin sequences at hidden node 35

The performance of RNN on classifying neurotoxin sequences and nontoxin sequences at hidden node 60

Results of PSI-BLAST on various E-values on neurotoxins dataset using five fold cross-validation

The MEME/MAST result of classification of neurotoxins and non-toxins at different E-value

The performance of various approaches used in prediction of neurotoxins and nontoxins

The performance of various approaches used in classification of neurotoxins based on source

The performance of various approaches used on classification of neurotoxins based on function

The performance of various modules including SVM modules on classification of ion channel inhibitors

The performance of the amino acid composition based SVM modules at default threshold (0.0) on proteins obtained from NCBI and Swiss-Prot of seven different species

Performance of SVM based method using amino acid composition

Performance of SVM based method using dipeptide composition
The probability of correct prediction of allergens and non-allergens is shown in terms of positive probability value (PPV) and negative probability value (NPV) respectively for SVM based methods using residue and dipeptide composition.

Searching of 178 IgE epitopes in protein dataset that consists of 578 allergens and 700 non-allergens using different percent identity (PID) cut-off.

MEME/MAST results of allergen and non-allergen motifs. It shows allergen hits out of total 578 allergens and non-allergen hits out of total 700 non-allergens.

The search results of 1364 proteins (664 allergens & 700 non-allergens), which searched against ARPs database using BLAST.

The performance of hybrid approach, which combines SVM based approach using amino acid composition and IgE epitope based approach (PID865).

The performance of hybrid approach, which combines SVM based approach using amino acid composition and motif based approach (MEME E-value 0.1).

The performance of various approaches on independent dataset.

Performance of different methods on 101725 non-allergens obtained from Swiss-Prot and on 323 allergens (independent dataset not used in training or testing of methods).

Statistics on pathogen group and immunogenicity vice distribution of B-cell epitopes in Bcipep database.

The scale of 20 values of the physico-chemical properties.

Results of B-cell epitope prediction methods based on different physico-chemical properties.

Results of B-cell epitope prediction methods based on combination of different physico-chemical properties.

Creation of fixed length patterns of 20 or less than 20 amino acids from B-cell epitopes.

The performance of RNN at 0.5 threshold, window size 16 and using single hidden layer of different nodes.
