2.1.8 Intrinsic tryptophan fluorescence ................................................... 28
2.1.9 Circular dichroism studies ........................................................... 30
2.2 Results .......................................................................................... 31
2.2.1 Light scatter ................................................................................ 31
2.2.2 Interaction of bis-ANS with the lipase ........................................ 32
2.2.3 Activity and intrinsic fluorescence of lipase in GdmCl ................ 33
2.2.4 Circular dichroism of lipase ......................................................... 35
2.3 Discussion ...................................................................................... 36

Chapter 3 Generation of thermostable mutants of the Bacillus subtilis lipase by directed evolution
3.0 Introduction ................................................................................... 39
3.1 Materials and Methods .................................................................. 41
3.1.1 Materials .................................................................................. 41
3.1.2 Synthesis of chromogenic substrates for lipase assays .............. 41
3.1.3 Preparation of substrate stocks ................................................ 42
3.1.4 Assay with Triolein .................................................................. 42
3.1.5 Design of construct for random mutagenesis and screening ...... 43
3.1.6 Random mutagenesis ................................................................. 43
3.1.7 Site-directed mutagenesis ........................................................... 44
3.1.8 Recombination .......................................................................... 45
3.1.9 Screening .................................................................................. 47
3.1.10 Protein purification ................................................................. 48
3.1.11 Half-lives of thermal inactivation ......................................... 48
3.1.12 Enzyme Kinetics ................................................................... 48
3.1.13 Molecular modelling ............................................................... 48
3.2 Results and discussion .................................................................. 49

Chapter 4 pH-dependent thermostability and evidence for pH-dependent conformational changes of the Bacillus subtilis lipase
4.0 Introduction ................................................................................... 57
4.1 Materials and Methods ................................................................ 60
4.1.1 Buffers and solutions ............................................................... 60
4.1.2 Measurement of residual activities ................................................ 60
4.1.3 Fluorescence ............................................................................ 61
4.1.4 Circular dichroism ...................................................................... 61
4.2 Results and discussions .............................................................. 61

Chapter 5 Structural changes in Triton X-100 micelles in guanidinium chloride: Implications in lipase assays

5.0 Introduction .................................................................................. 67
5.1 Materials and methods ................................................................. 70
5.1.1 Materials .................................................................................. 70
5.1.2 Enzyme assays ........................................................................ 71
5.1.3 CMC determination ................................................................. 72
5.1.4 Dynamic light scattering ............................................................ 72
5.1.5 Fluorescence studies ................................................................. 73
5.2 Results and discussions ................................................................. 74
5.2.1 Enzyme catalyzed hydrolysis of p-nitrophenyl esters in guanidinium chloride ................................................................. 74
5.2.2 Non-enzymatic hydrolysis of p-nitrophenyl esters in guanidinium chloride ................................................................. 76
5.2.3 Critical micelle concentration .................................................... 78
5.2.4 Size ......................................................................................... 79
5.2.5 Fluorescence studies ................................................................. 81
5.3 Conclusion .................................................................................... 84

Concluding remarks and future directions ........................................ 89
References ....................................................................................... 92
