Scope for further Research

The findings of the present investigation may stimulate further research in the following problems related to Level of Aspiration.

1. The significant effect of sex on Level of Aspiration behaviour of the college students can be verified on boys and girls of low age groups. The findings in this field may supplement the studies on the development of Level of Aspiration.

2. Studies on this very problem may be conducted by taking different types of performance and non-performance tasks used for the study of Level of Aspiration behaviour. Results obtained from these studies may help in the verification of the view that Level of Aspiration is a general trait of the personality.

3. Studies on Level of Aspiration may be conducted on rural and urban, employed and unemployed samples, college and School teachers. Various other samples can also be taken to verify the results and establish the hypothesis.

contd...235
4. The Socio Economic Status scale may be standardized on the population on which the study is to be made. Then the Level of Aspiration behaviour of a particular Socio Economic status group may be compared under different cultural conditions.

5. By introducing success and failure among the students experimentally in the class, the rise or fall in their Level of Aspiration if any may be observed.

6. Relationship between actual performance in the class and performance in the Level of Aspiration tasks in artificial situations inside the laboratory may also be examined.
