List of figures

1.1 A schematic representation of p53 under different cellular stress and playing a important role in different regulatory pathways. .................. 2
1.2 p53 triggers apoptosis. ................................................................. 4
1.3 (A) Different phases of cell: Transition of normal cell to stressed, cancerous, apoptotic cell. (B) Cytotoxic therapy: Adapted from Cheok, et al [27]. ................................................................. 8
1.4 The p53-Mdm2 autoregulatory feedback loop and Nutlin-3 in Mdm2 and inhibits the interaction of Mdm2 with p53 [42]. ...................... 11
1.5 (A) p53 regulatory pathways and Nutlin-3a therapy [52]. (B) Nutlin concentration can drive the p53 dynamic to various oscillating states namely: stabilized or steady state, first damped oscillating state, sustain oscillation state, second damped oscillation state and apoptotic state. ................................................................. 14
3.1 The schematic presentation of biochemical network of p53 and Wnt modules and their cross talk via Gsk3. ................................. 64
3.2 The dynamics of p53 and Gsk3 for different values of $k_{35}$ i.e. 0.06, 0.18, 0.24, 0.6 and 1.2 for fixed value of $k_{22} = 0.02$. The right hand panels are the two dimensional plots the p53 and Gsk3 with Nutlin for the same set of parameter values showing different state behaviours. ................................................................. 72
3.3 The dynamics of Axin2 and $\beta$-catenin for different values of $k_{35}$ i.e.
0.06, 0.18, 0.24, 0.6 and 1.2 for fixed value of $k_{22} = 0.02$. The right hand panels are the two dimensional plots the Axin2 and $\beta$-catenin with Nutlin for the same set of parameter values showing different state behaviours. ................................. 74

3.4 The dynamics of Plots of p53, Axin2 and $\beta$-catenin as a function of time for $k_{22}$ values 0.0002, 0.0003, 0.01, 0.025 and 0.08, for fixed values of $k_{35}$. The upper right panels shows the two dimensional plots of p53 and $\beta$-catenin with Axin2 for same set of $k_{22}$ and $k_{35}$ parameter values. ................................. 75

3.5 The amplitudes of Axin2 ($x_{1}^{A}$), $\beta$-catenin ($x_{3}^{A}$), Gsk3 ($x_{6}^{A}$) and p53($x_{7}^{A}$) as a function of $k_{35}$ for various $k_{39}$ values 0.030, 0.035, 0.040, 0.045 and 0.050 (upper four panels). The lower four panels are the maxima of Axin2 ($x_{1}^{M}$), $\beta$-catenin ($x_{3}^{M}$), Gsk3 ($x_{6}^{M}$) and p53 ($x_{7}^{M}$) for the set of parameter values. ................................. 79

3.6 The amplitudes of Axin2 ($x_{1}^{A}$), $\beta$-catenin ($x_{3}^{A}$), Gsk3 ($x_{6}^{A}$) and p53($x_{7}^{A}$) as a function of $k_{22}$ for various $k_{39}$ values 0.030, 0.035, 0.040, 0.045 and 0.050 (upper four panels). The lower four panels are the maxima of Axin2 ($x_{1}^{M}$), $\beta$-catenin ($x_{3}^{M}$), Gsk3 ($x_{6}^{M}$) and p53 ($x_{7}^{M}$) for the set of parameter values. ................................. 81

4.1 The schematic diagram of SMAR1 driven p53 regulatory network 88

4.2 Workflow of the methods we implemented in the analysis of the model system ................................. 90
4.3 The diverse dynamical states of p53 dynamics driven by SMAR1.
(A) Time series dynamical states of p53. (B) Permutation entropy spectrum of three states. (C) Multifractal analysis: plot of Hurst exponent($H_q$), multifractal generalized dimension ($D_q$) as a function of parameter q. (D) Amplitudes of p53($A_{p53}$ of the dynamical states as a function of $k_{SMAR1}$). (E) Phase diagram in the parameter space ($k_{HDAC1}$, $k_{SMAR1}^c$ and ($k_{P300}$, $k_{SMAR1}^c$) and their respective average amplitudes. (F) Network constructed from the dynamical states using visibility graph approach. (G) Topological properties of the networks corresponding to various dynamical states: The 1st, 2nd, 3rd, 4th, 5th and 6th columns are for $P^{p53}(k)$ vs k, $C^{p53}(k)$ vs k, $C_N^{p53}(k)$ vs k, $C_B^{p53}(k)$ vs k, $C_C^{p53}(k)$ vs k, $C_E^{p53}(k)$ vs k respectively.

4.4 (A) The diverse dynamical states of Mdm2 dynamics driven by SMAR1. (A) Time series dynamical states of Mdm2. (B) Permutation entropy spectrum of three states. (C) Multifractal analysis: plot of Hurst exponent($H_q$), multifractal generalized dimension ($D_q$) as a function of parameter q. (D) Amplitudes of p53($A_{Mdm2}$ of the dynamical states as a function of $k_{SMAR1}$). (E) Network constructed from the dynamical states using visibility graph approach. (G) Topological properties of the networks corresponding to various dynamical states: The 1st, 2nd, 3rd, 4th, 5th and 6th columns are for $P^{Mdm2}(k)$ vs k, $C^{Mdm2}(k)$ vs k, $C_N^{Mdm2}(k)$ vs k, $C_B^{Mdm2}(k)$ vs k, $C_C^{Mdm2}(k)$ vs k, $C_E^{Mdm2}(k)$ vs k respectively.
4.5 Phase diagram of dynamical states driven by SMAR1. (A) Plot of $A_{p53}$ as a functions of $k_{HDAC1}$ driven by SMAR1($k_{SMAR1}$) (B) Regulation of apoptosis: Phase diagram in the parameter space $(k_{SMAR1}, k_{HDAC1})$ showing normal, stress and apoptosis with interaction mechanisms(indicating by arrows) (C) SMAR1 driven phase diagram: Plot of $\Delta k_{HDAC1}^S$ as a function of $k_{SMAR1}$.

5.1 The schematic diagram of Notch-Wnt-p53 cross-talk model.

5.2 Cis-inhibition and Trans-activation in Notch-Wnt-p53 cross-talk model.

5.3 Dynamical states of stress p53 driven by Nutlin, and stress propagation: (A) Dynamical states of p53 for different $k_{35}$ values. (B, I, M) Complexity measurement characterized by calculated permutation entropy $S_{p53}$, $S_{Notch}$, $S_{Axin2}$ values of the corresponding dynamical states of p53, Notch, Axin2 respectively. (C, J, N) Multifractal calculations of the dynamical states of p53, Notch, Axin2 respectively: plots of $F_s$ vs $s$, $H_q$ vs $q$ and $D_q$ vs $q$, (D) $A_{p53}$ as a function of $k_{35}$ for different values of $k_{39}$;..., (E) Phase diagram in the parameter space $(k_{39}, k_{35}^c)$, where $k_{35}^c$ are the values of $k_{35}$ cut by horizontal line, and $\Delta k_{35}$ is the range of $k_{35}$ occupied by sustain oscillation, F. Schematic diagram of stress signal propagation. (G, K, O) Topological properties of networks constructed from the time series of corresponding dynamical states of p53, Notch, Axin2 respectively: $P(k)$, $C(k)$, $C_n(k)$, $C_B(k)$, $C_C(k)$ and $C_E(k)$ as a function of degree $k$. (H, L) Propagated signal received by Notch and Axin2 respectively, and corresponding dynamical states.
5.4 Dynamical states of stress p53 driven by Axin2, and stress propagation: (A) Dynamical states of p53 for different $k_{22}$ values, (B) Permutation entropy $S_{p53}$ values of the corresponding dynamical states, (C,J) Multifractal calculations of p53 and Axin2: plots of $F_s$ vs $s$, $H_{q_{p53}}^s$ vs $q$ and $D_q$ vs $q$. (D) $A_{p53}$ as a function of $k_{22}$ for various values of $k_{39}$...., (E) Phase diagram in the parameter space $(k_{39}, k_{22})$, and $\Delta k_{22}$ is the range of $k_{22}$ occupied by sustain oscillation, (F) Schematic diagram of stress signal propagation, (G, K) Topological properties of networks of corresponding dynamical states: $P(k)$, $C(k)$, $C_n(k)$, $C_B(k)$, $C_C(k)$ and $C_E(k)$ as a function of degree $k$, (H) Propagated signal received by Notch and corresponding dynamical states, (I) Permutation entropy ($H_{\text{Notch}}$) calculations. 133

5.5 Cross-talk of pathways and properties: (A) Dynamics of stress p53 triggered by Nutlin (red), Nutlin plus Wnt (blue), and Nutlin plus Wnt plus Notch (maroon), (B) permutation entropy measures of these cross-talks, (C) corresponding multifractal measures: $F_s$ vs $s$, $H_q$ vs $q$, and $D_q$ vs $q$ plots, (D) $A_{p53}$ corresponding to the cross-talks, (E) topological properties of the corresponding networks: $P(k)$, $C(k)$, $C_n(k)$, $C_B(k)$, $C_C(k)$ and $C_E(k)$ as a function of degree $k$. 137

6.1 A schematic diagram of p53–Mdm2-miR–125b network model. 143

6.2 (A) Dynamical states of p53 and their temporal behaviours when ROS act as a stress inducer whereas miR-125b creation rate ($k_{\text{miR–125b}} = 0$) is kept fixed. (B) The dynamical states of p53 driven by miR-125b stress inducer when ROS creation rate $k_{\text{ROS}} = 0.00005$ is kept fixed. 150

7.4 Topological properties of the ovarian cancer network. (A) The behaviours of degree distributions ($P(k)$), clustering co-efficient ($C(k)$), neighborhood connectivity ($C_N(k)$), betweenness ($C_B(k)$), closeness ($C_C(k)$) and eigenvector ($C_E(k)$) measurements as a function of degree $k$ for original and five FKRs knock-out network at different levels of organization. (B) The changes in the exponents of the six topological parameters due to FKRs knock-out experiment. (C) Energy distribution in the network quantified by Hamiltonian calculation as a function of network levels. (D) Changes in the network modules/sub-modules due to five FKRs knock-out experiment. The dotted modules/sub-modules are the break-down modules/sub-modules.

7.5 Network/modules/sub-modules at different network levels which accommodate leading hubs and fundamental key regulators. The probability distributions of the FKRs as a function of level.

7.6 Properties of AKT1. (A) The tracing of AKT1 in network/modules/sub-modules at various network levels. (B) The variation of $LCL$ as a function of $CN$ for different levels. (C) Organization of five FKRs with Tp53. (D) Directional tracing of AKT1 at various network levels. Rich-club parameter as a function of $k$. $P_H$ and $P_{LCP}$ as a function of level.

7.7 LCP correlation as a function of $CN$ for different modules/sub-modules and their distribution.

8.1 Schematic diagram of workflow of the methodology implemented in this work.
8.2 Plots of the degree and centrality based identification of first top twenty genes in each measurement. The percentage of common overlapping of the identified genes by the four measurements.

8.3 Topological properties of the breast cancer network. The lines are fitted lines with power laws in the data sets.

8.4 Sub-networks constructed corresponding to most frequently repeated non-breast cancer genes (A, B, C, D, E) and their compactness characterized by two dimensional plots between $\sqrt{LCL}$ versus CN (F). Plots of $P_H$ and $P_{LCP}$ for frequently repeated five non-breast cancer genes (G).

9.1 Showing the degree distribution, clustering co-efficient, Avg neighborhood connectivity i.e. $P(k)$, $C(k)$ and $C_n$ vs. $k$ graph respectively, After Knock out experiment at 0, 10, 20, 30, 40, 50, 100 nodes removal and it is also fitted to the power law with exponent with $\gamma$, $\alpha$, $\beta$ falling in range of Characteristic hierarchical networks $(0 \leq \gamma \leq 2)$, $(\alpha \sim 1)$ and $(\beta \leq 1)$ respectively; Showing the betweenness centrality, closeness centrality and eigenvector Centrality i.e. $C_b$, $C_c$ and $C_e$ vs. $k$ graph respectively, After Knock out experiment at 0, 10, 20, 30, 40, 50, 100 nodes removal and it is also fitted to the power law with exponent $\epsilon$, $\delta$ and $\mu$ in order.

9.2 Paths of fundamental key regulators from complete network to motif through various modules/sub-modules at various level of organization. The probability distribution of the seven fundamental key regulators as a function of level of organization.

9.3 The structures of modules/sub-modules through which the first ten leading hubs passed through.
9.4 The modular path of p53 from complete network to motif with the structures of modules/sub-modules at various levels in which p53 is accommodated. (A) The plots of LCP-correlation as a function of CN for each modules/submodules (plots corresponding to each module/sub-module of the network) of p53 path. (B) The plots of $P_H$ and $P_{LCP}$ as a function of level of organization. . . . . . . . . . 220

9.5 Compactness of breast cancer network: (A) LCP-correlation calculation as a function of CN for second and third level modules when zero, five and fifty leading hubs are removed. (B) Representation of modules/sub-modules based on the values of LCP-correlation values: modules with red color are for $LCP - corr \geq 0.8$, and green color modules are for $LCP - corr < 0.8$. . . . . . . . . . . . . . . . . . . . . . . . . . . . . 221
