LIST OF FIGURES & TABLES

Figure 1.1: Clinical and immunological classification of the leprosy disease spectrum.

Figure 1.2: Clinical translations of findings from numerous methodologies adopted in genetic research.

Figure 2.1: Dissemination of leprosy around the globe.

Figure 2.2: Rates of new case detection and prevalence of leprosy in the world (WHO 2010).

Figure 2.3: Declining leprosy prevalence in India.

Figure 2.4 (a): Registered leprosy cases in India (March 2010).

Figure 2.4 (b): Leprosy Prevalence Rate (PR) and New Case Detection Rate (NCDR) per 10,000 population in India from: 1991-2010.

Figure 2.5. Clinical and immunological classification of the leprosy disease spectrum.

Figure 2.6. Schematic model of the cell envelope of M. leprae.

Figure 2.7. The extent of gene reduction and decay in the genome of M. leprae.

Figure 2.8. Genes and gene products involved in the immune response to M. leprae.

Figure 2.9. Entry of M. leprae into Schwann cells.

Figure 2.10. A schematic presentation showing host–environment interaction stages in the course of infection such as lepros.
Figure 2.11. *M. leprae* infection and the two stage genetic control of susceptibility to infection.

Figure 2.12. Strategies for identifying susceptibility genes that contribute to leprosy phenotypes.

Figure 3.1: *An overview of iPLEX Gold Reaction.*

Figure 3.2: *Screen shot of Typer Analyser software (SEQUENOM).*

Figure 3.3: *Vectors used for cloning of PARK2 and PACRG region in to pGL3 basic vector and pGL3 promoter vector.*

Figure 3.4 (a, b): *Sequence confirmation of cloned SNP region in pGL3 vectors and their SDM.*

Figure 3.5 (a, b): *Sequence confirmation of cloned SNP region in pGL3 vector and their SDM.*

Figure 3.7 (a-d): *Sequence confirmation of cloned SNP region in pGL3 vector and their SDM.*

Figure 4.1: *A partial map of Chromosome-6q26.*

Figure 4.2: *Bin structure of 96 SNPs studied in PARK2 and PARCG gene region.*

Figure 4.3: *A schematic lay-out of the BIN comparison for r^2 > 0.80 in the regulatory region of the PARK2 and PACRG genes in Indian (North and East Indian-Orissa) and Vietnamese population.*

Figure 4.4: *Evolutionary conservation of 2 (rs9365492 and rs9355403) significantly associated variants across 4 species compared with humans. H-Humans, C-Chimpanzee, G-Gibbon, R-Rhesus, G-Gorilla, B-Baboon.*

Figure 4.5: *Luciferase expression assay of upstream SNPs of PARK2 gene.*
Figure 4.6 A: SNP Interaction analysis of PARK2 and PACRG gene regulatory region SNPs rs9365492 and rs9355403 with the SNPs of anti-inflammatory cytokines gene.

Figure 4.6 B: SNP Interaction analysis of PARK2 and PACRG gene regulatory region SNPs rs9365492 and rs9355403 with the SNPs of gene spanning HLA III at 6p21.3 chromosomal region including pro-inflammatory cytokines TNF-alpha and LT-alpha.

Figure 5.1: A comparison of Bin structure between different HapMap, Indian and Vietnamese populations. Bin structures in populations with similar breakage in LD shown with unfilled circles. Cross marks represents the SNPs not studied in a given population.

Table 2.1: Epidemiological Situation in India.

Table 3.1: Characteristics of SNPs used in primary scan of selected region of PARK2 and PACRG genes in Indian samples using Sequenom Mass Array.

Table 3.2: Details of PCR and UEPs primer sequences of selected SNPs designed by Sequenom’s Assay Design software along with their masses and extended alleles, studied for association with Leprosy in Indian population groups.

Table 4.1: Allele and Genotype frequencies for 11 significant SNPs within PARK2 and PACRG gene regulatory region in two different cohorts of patients with Leprosy.

Table 4.2: Association statistics of SNPs in PARK2 and PACRG gene in total leprosy patients and its subtypes.

Table 4.3: Association statistics of SNPs within PARK2 and PACRG gene regulatory region in different cohorts of leprosy samples.

Table 4.4: Analysis of SNPs within PARK2 and PACRG gene in association with the subtypes
of leprosy compared to healthy controls in two different cohorts of Indian population.

**Table 4.5:** Haplotype structure, haplotype frequencies, significant $p$ values and odds ratio between patients versus healthy controls. *a.* Haplotype structure of 11 significantly associated SNPs, *b.* Haplotype structure of 8 SNPs representing BIN-1 of Indian population, *c.* Haplotype structure of 3 SNPs representing BIN-2 of Indian population.

**Table 4.6:** Describe the allele combination of 4 clones generated for 2 SNPs, located upstream of the PARK2 gene regulatory region and their Bioinformatics prediction result for transcription binding at different alleles by using TRANSFEC and HaploReg database.

**Table 4.7:** Interaction analysis of PARK2 SNPs with SNPs of genes providing risk towards Leprosy susceptibility.

**Table 4.8:** Interaction analysis of PARK2 SNPs with SNPs of genes providing protection towards Leprosy susceptibility.

**Table 4.9:** Combined interaction analysis of the SNPs providing protection and risk towards Leprosy susceptibility.
