LIST OF FIGURES

Fig 1.1  Pathophysiology of diabetic acidosis (Metabolic & Endocrine physiology)

Fig 1.2  Sites of action of oral antihyperglycaemic drugs.

Fig 1.3  A guide to the selection of oral antihyperglycaemic drugs

Fig 1.4  Possible links between hyperglycaemia-induced oxidative stress and diabetic complications.

Fig 1.5  Possible sites of action to account for the protective effects of antioxidants against oxidative stress-induced insulin resistance.

Fig 2.1  Chemical structures of Vitamin C, Alpha lipoic acid, vitamin E & glutathione.

Fig 2.2  Regeneration of vitamin E by alpha-lipoic acid, dihydrolipoic acid, vitamin C & Glutathione.

Fig 4.1a  Effect of single oral dose of aqueous root, aqueous root +ALA & glibenclamide on blood glucose level in alloxan induced diabetic rats (n=5). Blood samples were taken at 0, 5, 15, 24 & 48 h after the administration of vehicle & drugs. Results are expressed as mean change in blood glucose level (mg/dl).

Fig 4.1b  Effect of single oral dose of aqueous root, aqueous root +ALA & glibenclamide on diabetic rats (n=5). Blood samples were taken at 5, 15, 24 & 48 h intervals and results are expressed as percent change in blood glucose as compared to diabetic control.

Fig 4.2a  Effect of single oral dose of aqueous root, aqueous root +ALA & glibenclamide on superoxide dismutase (SOD) level in alloxan induced diabetic rats (n=5). Blood samples were taken at 0, 5, 15, 24 & 48 h after the administration of vehicle & drugs. Results are expressed as mean change in SOD level (unit/mg protein).

Fig 4.2b  Effect of single oral dose of aqueous root, aqueous root +ALA & glibenclamide on diabetic rats (n=5). Blood samples were taken at 5, 15, 24 & 48 h intervals and results are expressed as percent change in superoxide dismutase level as compared to diabetic control.
Fig 4.3a  Effect of single oral dose of aqueous root, aqueous root + ALA & glibenclamide on catalase level in alloxan induced diabetic rats (n=5). Blood samples were taken at 0, 5, 15, 24 & 48 h after the administration of vehicle & drugs. Results are expressed as mean change in catalase level (n mole of H₂O₂/min/mg protein).

Fig 4.3b  Effect of single oral dose of aqueous root, aqueous root + ALA & glibenclamide on blood sugar level in diabetic rats (n=5). Blood samples were taken at 0, 5, 15, 24 & 48 h intervals and results are expressed as percent change in blood glucose level as compared to diabetic control.

Fig 4.4a  Effect of single oral dose of ethanolic leaf, ethanolic leaf + ALA & glibenclamide on blood sugar level in alloxan induced diabetic rats (n=5). Blood samples were taken at 0, 5, 15, 24 & 48 h after the administration of vehicle & drugs. Results are expressed as mean change in blood glucose level (mg/dl).

Fig 4.4b  Effect of single oral dose of ethanolic leaf, ethanolic leaf + ALA & glibenclamide on superoxide dismutase (SOD) level in alloxan induced diabetic rats (n=5). Blood samples were taken at 0, 5, 15, 24 & 48 h after the administration of vehicle & drugs. Results are expressed as mean change in SOD level (unit/mg protein).

Fig 4.5a  Effect of single oral dose of ethanolic leaf, ethanolic leaf + ALA & glibenclamide on superoxide dismutase (SOD) level in alloxan induced diabetic rats (n=5). Blood samples were taken at 0, 5, 15, 24 & 48 h after the administration of vehicle & drugs. Results are expressed as mean change in SOD level (unit/mg protein).

Fig 4.5b  Effect of single oral dose of ethanolic leaf, ethanolic leaf + ALA & glibenclamide on superoxide dismutase level in diabetic rats (n=5). Blood samples were taken at 0, 5, 15, 24 & 48 h intervals and results are expressed as percent change in superoxide dismutase level as compared to diabetic control.

Fig 4.6a  Effect of single oral dose of ethanolic leaf, ethanolic leaf + ALA & glibenclamide on catalase level in alloxan induced diabetic rats (n=5) Blood samples were taken at 0, 5, 15, 24 & 48 h after the administration of vehicle & drugs. Results are expressed as mean change in catalase level (n mole of H₂O₂/min/mg protein).

Fig 4.6b  Effect of single oral dose of ethanolic leaf, ethanolic leaf + ALA & glibenclamide on catalase level in diabetic rats (n=5). Blood samples were taken at 5, 15, 24 & 48 h intervals and results are expressed as percent change in catalase level as compared to diabetic control.
Fig 4.7a  Effect of single oral dose of ethanolic root, ethanolic root +ALA & glibenclamide on blood sugar level in alloxan induced diabetic rats (n=5). Blood samples were taken at 0, 5, 15, 24 & 48 h after the administration of vehicle & drugs. Results are expressed as mean change in blood glucose level (mg/dl).

Fig 4.7b  Effect of single oral dose of ethanolic root, ethanolic root +ALA & glibenclamide on diabetic rats (n=5). Blood samples were taken at 5, 15, 24 & 48 h intervals and results are expressed as percent change in blood glucose level as compared to diabetic control.

Fig 4.8a  Effect of single oral dose of ethanolic root, ethanolic root +ALA & glibenclamide on superoxide dismutase (SOD) level in alloxan induced diabetic rats (n=5). Blood samples were taken at 0, 5, 15, 24 & 48 h after the administration of vehicle & drugs. Results are expressed as mean change in SOD (unit/mg protein).

Fig 4.8b  Effect of single oral dose of ethanolic root, ethanolic root +ALA & glibenclamide on diabetic rats (n=5). Blood samples were taken at 5, 15, 24 & 48 h intervals and results are expressed as percent change in superoxide dismutase level as compared to diabetic control.

Fig 4.9a  Effect of single oral dose of ethanolic root, ethanolic root +ALA & glibenclamide on catalase level in alloxan induced diabetic rats (n=5). Blood samples were taken at 0, 5, 15, 24 & 48 h after the administration of vehicle & drugs. Results are expressed as mean change in catalase level (n mole of H2O2/min/mg protein).

Fig 4.9b  Effect of single oral dose of ethanolic root, ethanolic root +ALA & glibenclamide on diabetic rats (n=5). Blood samples were taken at 5, 15, 24 & 48 h intervals and results are expressed as percent change in catalase level as compared to diabetic control.

Fig 4.10a  Effect of repeated oral dose of ethanolic leaf, ethanolic leaf +ALA, aqueous root, aqueous root +ALA & glibenclamide on blood glucose level in alloxan induced diabetic rats (n=5). Blood samples were taken at 0, 5, 15 & 30 days after the administration of vehicle & drugs. Results are expressed as mean change in blood glucose level (mg/dl).

Fig 4.10b  Effect of repeated oral dose of ethanolic leaf, ethanolic leaf +ALA, aqueous root, aqueous root +ALA & glibenclamide on diabetic rats (n=5). Blood samples were taken at 5, 15 & 30 days intervals and results are expressed as percent change in blood glucose level as compared to diabetic control.
Effect of repeated oral dose of ethanolic leaf, ethanolic leaf +ALA, aqueous root, aqueous root +ALA & glibenclamide on fructosamine level in alloxan induced diabetic rats (n=5). Blood samples were taken at 0, 5, 15 & 30 days after the administration of vehicle & drugs. Results are expressed as mean change in fructosamine level (umole/L).

Effect of repeated oral dose of ethanolic leaf, ethanolic leaf +ALA, aqueous root, aqueous root +ALA & glibenclamide on diabetic rats (n=5). Blood samples were taken at 5, 15 & 30 days intervals and results are expressed as percent change in fructosamine level as compared to diabetic control.

Effect of repeated oral dose of ethanolic leaf, ethanolic leaf +ALA, aqueous root, aqueous root +ALA & glibenclamide on total cholesterol level in alloxan induced diabetic rats (n=5). Blood samples were taken at 0, 5, 15 & 30 days after the administration of vehicle & drugs. Results are expressed as mean change in total cholesterol level (mg/dl).

Effect of repeated oral dose of ethanolic leaf, ethanolic leaf +ALA, aqueous root, aqueous root +ALA & glibenclamide on diabetic rats (n=5). Blood samples were taken at 5, 15 & 30 days intervals and results are expressed as percent change in total-cholesterol level as compared to diabetic control.

Effect of repeated oral dose of ethanolic leaf, ethanolic leaf +ALA, aqueous root, aqueous root +ALA & glibenclamide on triglyceride level in alloxan induced diabetic rats (n=5). Blood samples were taken at 0, 5, 15 & 30 days after the administration of vehicle & drugs. Results are expressed as mean change in triglyceride level (mg/dl).

Effect of repeated oral dose of ethanolic leaf, ethanolic leaf +ALA, aqueous root, aqueous root +ALA & glibenclamide on diabetic rats (n=5). Blood samples were taken at 5, 15 & 30 days intervals and results are expressed as percent change in triglyceride level as compared to diabetic control.

Effect of repeated oral dose of ethanolic leaf, ethanolic leaf +ALA, aqueous root, aqueous root +ALA & glibenclamide on high density lipoprotein-cholesterol (HDL) level in alloxan induced diabetic rats (n=5). Blood samples were taken at 0, 5, 15 & 30 days after the administration of vehicle & drugs. Results are expressed as mean change in HDL-cholesterol level (mg/dl).

Effect of repeated oral dose of ethanolic leaf, ethanolic leaf +ALA, aqueous root, aqueous root +ALA & glibenclamide on diabetic rats (n=5). Blood samples were taken at 5, 15 & 30 days intervals and results are expressed as percent change in high density lipoprotein-cholesterol level as compared to diabetic control.
Fig 4.15a Effect of repeated oral dose of ethanolic leaf, ethanolic leaf +ALA, aqueous root, aqueous root +ALA & glibenclamide on low density lipoprotein-cholesterol level in alloxan induced diabetic rats (n=5). Blood samples were taken at 0, 5, 15 & 30 days after the administration of vehicle & drugs. Results are expressed as mean change in LDL-cholesterol level (mg/dl).

Fig 4.15b Effect of repeated oral dose of ethanolic leaf, ethanolic leaf +ALA, aqueous root, aqueous root +ALA & glibenclamide on diabetic rats (n=5). Blood samples were taken at 5, 15 & 30 days intervals and results are expressed as percent change in low density lipoprotein-cholesterol level as compared to diabetic control.

Fig 4.16a Effect of repeated oral dose of ethanolic leaf, ethanolic leaf +ALA, aqueous root, aqueous root +ALA & glibenclamide on albumin level in alloxan induced diabetic rats (n=5). Blood samples were taken at 0, 5, 15 & 30 days after the administration of vehicle & drugs. Results are expressed as mean change in albumin level (g/dl).

Fig 4.16b Effect of repeated oral dose of ethanolic leaf, ethanolic leaf +ALA, aqueous root, aqueous root +ALA & glibenclamide on diabetic rats (n=5). Blood samples were taken at 5, 15 & 30 days intervals and results are expressed as percent change in albumin level as compared to diabetic control.

Fig 4.17a Effect of repeated oral dose of ethanolic leaf, ethanolic leaf +ALA, aqueous root, aqueous root +ALA & glibenclamide on lipid peroxidation level in alloxan induced diabetic rats (n=5). Blood samples were taken at 0, 5, 15 & 30 days after the administration of vehicle & drugs. Results are expressed as mean change in lipid peroxidation level (u mole/ml).

Fig 4.17b Effect of repeated oral dose of ethanolic leaf, ethanolic leaf +ALA, aqueous root, aqueous root +ALA & glibenclamide on lipid peroxidation level in diabetic rats (n=5). Blood samples were taken at 5, 15 & 30 days intervals and results are expressed as percent change in lipid peroxidation level as compared to diabetic control.

Fig 4.18a Effect of repeated oral dose of ethanolic leaf, ethanolic leaf +ALA, aqueous root, aqueous root +ALA & glibenclamide on superoxide dismutase (SOD) level in alloxan induced diabetic rats (n=5). Blood samples were taken at 0, 5, 15 & 30 days after the administration of vehicle & drugs. Results are expressed as mean change in SOD level (unit/mg protein).
Effect of repeated oral dose of ethanolic leaf, ethanolic leaf + ALA, aqueous root, aqueous root + ALA & glibenclamide on diabetic rats (n=5). Blood samples were taken at 5, 15 & 30 days intervals and results are expressed as percent change in superoxide dismutase level as compared to diabetic control.

Effect of repeated oral dose of ethanolic leaf, ethanolic leaf + ALA, aqueous root, aqueous root + ALA & glibenclamide on catalase level in alloxan induced diabetic rats (n=5). Blood samples were taken at 0, 5, 15 & 30 days after the administration of vehicle & drugs. Results are expressed as mean change in catalase level (n mole of H₂O₂/min/mg protein).

Effect of repeated oral dose of ethanolic leaf, ethanolic leaf + ALA, aqueous root, aqueous root + ALA & glibenclamide on body weight in alloxan induced diabetic rats (n=5). Blood samples were taken at 0, 5, 15 & 30 days after the administration of vehicle & drugs. Results are expressed as mean change in body weight (g).

Effect of repeated oral dose of ethanolic leaf, ethanolic leaf + ALA, aqueous root, aqueous root + ALA & glibenclamide on water intake in alloxan induced diabetic rats (n=5). Blood samples were taken at 0, 5, 15 & 30 days after the administration of vehicle & drugs. Results are expressed as mean change in water intake (ml).
LIST OF SLIDES

**Fig 4.22a** Section of normal pancreas showing four Islets of Langerhans (Original magnification X 10).

**Fig 4.22b** Section of diabetic pancreas showing one Islet of Langerhans (Original magnification X 10).

**Fig 4.22c** A section of pancreas from diabetic animals treated with aqueous root extract showing three Islets of Langerhans (Original magnification X 10).

**Fig 4.22d** A section of pancreas from diabetic animals treated with aqueous root +ALA showing two Islets of Langerhans (Original magnification X 10).

**Fig 4.22e** A section of pancreas from diabetic animals treated with standard drug-glibenclamide showing one Islet of Langerhans (Original magnification X 10).
