ACKNOWLEDGMENT

This work has been carried out in the laboratories of the Bengal Ceramic Institute (renamed as College of Ceramic Technology) and of the Department of Applied Chemistry, the University of Calcutta, under the guidance of Dr. S. K. Chatterjee, D.Sc., F.I.C., whose encouragement has all along been an inspiration for carrying out this investigation.

Thanks are due to Prof. Dr. H. N. Das Gupta, D.Sc., formerly Head of the Department of Silicate Technology, Benares Hindu University and at present Research Professor, University Grants Commission for his active interest and valued suggestions from time to time.

Thanks are also due to Prof. S. Roy, M.Sc., Principal, College of Ceramic Technology for offering general laboratory facilities and Dr. M. Adhikari, D.Phil., D.Sc., P.R.S., of the Physical Chemistry department and the Council of Scientific and Industrial Research, Government of India for offering necessary laboratory facilities for X-ray and Infrared absorption spectra.

Special thanks are due to Dr. R.E. Grim, Research Professor of Geology, University of Illinois, U.S.A. for kindly agreeing to make X-ray analysis of the five Indian Fireclay samples in 1960-61 (as such facility was not available to the author till 1965) and offer his valuable observations as to the contents. The X-ray study of the samples have, however, also been made by the author at a later date.

The author also wishes to express his thanks to his wife for her kind assistance in indexing the various references and to all those who helped him in this investigation in various ways.
