

CONTENTS

Abbreviations	I-III
List of Figures	IV-VII
Synopsis	1-11
Chapter 1	12-52
Activity-Dependent Alpha Tubulin Acetylation and its Regulation	
Introduction	12
Regulation of Protein Acetylation	13
Protein Acetylation in Long-Term Potentiation and Memory	14
Cytoskeletal Proteins in Long-Term potentiation and Memory	15
Tubulin Acetylation in Neurons	17
Materials and Methods	18
Animals	18
Hippocampal Slice Preparation	18
Insular Cortex Punch Isolation	19
Treatment Protocols	19
Sample Preparation	20
Western Blotting	21
Antibodies	22
Cell Fractionation	23
Microtubule Polymerization	23
PC12 Cell Culture and Treatment	24
Two-dimensional Gel Electrophoresis and Western Blotting	24
Sirtuin2 Activity Assay	26
Novel Object Recognition Task	27
Data Analysis	29
Results	31
Identification of p55, a Target of Histone Deacetylase Inhibitor, in the Hippocampus	31
Acp55K of Insular Cortex is Alpha Tubulin	33

Activity-Dependent Acetylation of Alpha Tubulin	34
Memory Training Increases Acetylation of Alpha Tubulin	37
Discussion	40
References	44
Chapter 2	53-77
Alpha Tubulin Acetylation Regulates Surface GluR1 Expression in the Hippocampus	
Introduction	53
Long-Term Potentiation	53
AMPA Receptors	53
AMPA Receptors in Long-Term Potentiation	54
Regulation of Surface AMPA Receptor Expression	55
Materials and Methods	57
Animals	57
Primary Hippocampal Neuronal Culture	57
Treatments	58
SDS-PAGE and Immunoblotting	58
Antibodies	60
Immunofluorescence	60
Double Immunolabeling	62
Cell Surface Protein Isolation	63
Co-Immunoprecipitation	64
Statistical Analysis	65
Results	66
Increasing Acetylation with Trichostatin A Increases Surface GluR1 Expression	66
Increasing Acetylation with Trichostatin A Increases GluR1 Receptors at the Synaptic Sites	67
Increasing Acetylation with Trichostatin A Increases Phosphorylation of GluR1	67
Increasing Tubulin Acetylation Enhances Surface GluR1	

Expression	68
Tubacin Increases Association between Alpha Tubulin and GluR1	68
CDK5 Activity is Required for KCl-Induced Increase in Surface Expression of GluR1	69
Discussion	70
References	73
Chapter 3	78-99
Increasing Protein Acetylation Facilitates Long-Term Memory Formation with Massed Training	
Introduction	78
Spacing Effect in Memory Formation	79
Spacing Effect and Synaptic Plasticity	79
Spacing Effect and Signaling Molecules	79
Histone Acetylation in LTM Formation	81
Materials and Methods	82
Animals	82
Water maze Apparatus	82
Handling	83
Training	83
Sodium Butyrate Injections	84
Cell Fractionation	85
Western Blotting	86
Antibodies	87
Statistical Analysis	87
Results	88
Comparison of 5-Day and 1-Day Spaced Training on Memory Formation	88
Single-day Spaced Training Forms Better Long-Term Memory than Single-Day Massed Training	89
Systemic Administration of Sodium Butyrate Increases Histone Acetylation in the Hippocampus	90

Sodium Butyrate Improves Long-Term Memory Formation with Massed Training	91
Discussion	93
References	96
Chapter 4	100-120
Poly(ADP)-Ribose Polymerase Activity is Required for Histone Deacetylase Inhibitor-Induced Enhancement of Long-Term Memory	
Introduction	100
Histone Modifications	100
Histone Acetylation in Memory Formation	101
Poly(ADP)-Ribosylation of Histones	102
Poly(ADP)-Ribosylation in Memory Formation	102
Histone Acetylation and Poly(ADP)-Ribosylation	103
Materials and Methods	105
Animals	105
Object Recognition Task	105
Drug Administration	107
Nuclear Extract Preparation	107
Isolation of Histone H1	108
Western Blotting	108
Antibodies	109
Data Analysis	109
Results	111
Memory Training Increases Poly(ADP)-Ribosylation of Histone H1	111
Histone Deacetylase Inhibitor Increases Poly(ADP)- Ribosylation of Histone H1 in the Hippocampus	112
PARP-1 Activity is Required for HDAC Inhibitor-Induced Poly(ADP)-Ribosylation of Histone H1	112
Blocking PARP Activity Inhibits LTM Formation	113

Histone Deacetylase Inhibition Causes a Weak Training to Form LTM	114
PARP Activity is Required for Histone Deacetylase Inhibitor- Induced Facilitation of LTM Formation	114
Discussion	116
References	119
Publication	121
