LIST OF FIGURES

Figure 1.1 : Gallbladder and the Cystic Duct .................................................................3
Figure 1.2 : Human Biliary System ....................................................................................3
Figure 1.3 : Anatomy of Human Biliary System .................................................................4
Figure 2.1 : Layers at different velocity ..............................................................................26
Figure 2.2 : Graph between strain and stress ....................................................................28
Figure 3.1 : Cosine shaped geometry of the cystic duct ....................................................34
Figure 3.2 : Composite shaped geometry of the cystic duct .............................................38
Figure 3.3(a): The variation of resistance to flow for cosine shaped geometry ..............42
Figure 3.3(b): The variation of resistance to flow for composite shaped geometry .......43
Figure 3.4 : Flow resistance for different geometry ...........................................................44
Figure 3.5 (a): The variation of shear stress for cosine shaped geometry ......................45
Figure 3.5 (b): The variation of shear stress for composite shaped geometry ..............46
Figure 4.1 : Bile flow from gallbladder to the duodenum ...............................................52
Figure 4.2 : The model of gallbladder and cystic duct with stone ...................................53
Figure 4.3 : The variation of resistance to flow with the stone height .........................59
Figure 5.1 : The geometry of the cystic duct with stone ..................................................64
Figure 5.2 (a): The variation of resistance to flow for no stone ....................................71
Figure 5.2 (b): The variation of resistance to flow for different stone height ...............72
Figure 5.2 (c): The variation of resistance to flow for different core radius .................73
Figure 5.3 : The variation of resistance to flow for different stone length .......................74
Figure 5.4 (a) : The variation of shear stress for different stone height ..........................75
Figure 5.4 (b) : The variation of shear stress for different core radius ...........................76
Figure 5.5 : The variation of shear stress with stone height for core radius ...................77
Figure 6.1 : The geometry of cystic duct with stone .........................................................84
Figure 6.2(a) : The variation of resistance for n=1 ...........................................................90
Figure 6.2(b) : The variation of resistance for n=1.5 .......................................................91
Figure 6.2(c) : The variation of resistance for n=2 ..........................................................92
Figure 6.3(a) : The variation of resistance for different conditions ..................................93
Figure 6.3(b) : The variation of resistance for different conditions .................................94
Figure 6.3(c) : The variation of resistance for different conditions .................................95
Figure 6.4(a) : The variation of shear stress for different conditions .................................96
Figure 6.4(b) : The variation of shear stress for different conditions .................................97
Figure 6.4(c) : The variation of shear stress for different conditions .................................98
Figure 6.5(a) : The variation of shear stress for different viscosity .................................99
Figure 6.5(b) : The variation of shear stress for different yield stress .............................100
Figure 6.6(a) : The variation of shear stress for n=1 ........................................................101
Figure 6.6(b) : The variation of shear stress for n=1.5 ......................................................102
Figure 6.6(c) : The variation of shear stress for n=2 ........................................................103
Figure 6.7(a) : The variation of shear stress at different viscosity for n=1 ........................104
Figure 6.7(b) : The variation of shear stress at different viscosity for n=1.5 ..................105
Figure 6.7(c) : The variation of shear stress at different viscosity for n=2 .......................106
Figure 6.8 : The variation of shear stress with axial distance ...........................................107
Figure 7.1 : Bile flow in elastic cystic duct along the z axis .............................................113
Figure 7.2 : The variation of flux for fluid index ..............................................................117
Figure 7.3 : The variation of flux for fluid index ..............................................................118
Figure 8.1 : The flow through cystic duct .....................................................................123
Figure 8.2 : The variation of the flow for different fluid index .......................................128
Figure 8.3 : The variation of the flow for different radius ...............................................129
Figure 8.4 : The variation of the flow for different g .........................................................130
Figure 8.4 : The variation of the flow for different viscosity ...........................................131
Figure 9.1 : The geometry of the overlapping stone in the cystic duct ..........................137
Figure 9.2 : The shape of the central layer .....................................................................137
Figure 9.3(a) : The variation of resistance to flow for different values of µ ..................144
Figure 9.3(b) : The variation of resistance to flow for different values of α ...............145
Figure 9.3(c) : The variation of resistance to flow for different stone length .............146
Figure 9.4(a) : The variation of shear stress with axial distance for viscosity ..........147
Figure 9.4(b) : The variation of shear stress with axial distance for α .........................148
Figure 9.4(c) : The variation of shear stress with axial distance for stone height .....149
Figure 9.5(a) : The variation of shear stress at throat of stone for viscosity ..........150
Figure 9.5(b) : The variation of shear stress at throat of stone for $\alpha$ .......................151
Figure 9.6(a) : The variation of shear stress with stone ratio for viscosity .................152
Figure 9.6(b) : The variation of shear stress with stone ratio for $\alpha$ .........................153
Figure 9.7(a) : The variation of shear stress at throat and critical height for $\mu$ ............154
Figure 9.7(b) : The variation of shear stress at throat and critical height for $\alpha$ ............155
