This thesis represents not only my work at the keyboard, it is a milestone in more than half decade of laboratory work at Department of Chemistry, Gujarat University. I have been accompanied and supported by many people during my journey at the department, and it has been nothing short of amazing. All those, who have been instrumental in bringing this thesis to completion, deserves a special mention with sincere respect and my deep sense of gratitude. First and foremost, I would like to thank the ever so giving Almighty God and my parents whose protective hands over my bowed head proved sustaining and enlivening.

I would like to express my deep sense of gratitude to my research supervisor, a wonderful humane and great scholar, Prof. Pranav Shrivastav, Department of Chemistry, Gujarat University. To begin with, I thank him for providing me an opportunity to join his team as a research scholar, and giving access to the laboratory and research facilities. He has always been a source of inspiration for his entire ‘academic family’, and it would be righteous to admire him for all my academic potentials. I also cherish the amount of freedom I have enjoyed during the entire period of my research work, and in fact his unrelenting support, practical advice and optimism have helped to keep me going, and dragged me to the finish line.

I also wish to express my very profound gratitude to Prof. (Ms.) Nisha K. Shah, Head of the Department of Chemistry, for sharing her pearls of wisdom with me during the course of this research. She has always provided me with unfailing support and continuous assistance throughout my years of study and through the process of researching. To recall, she was the one who has always believed in me and inspired me in many ways.

My sincere thanks are due to all the people who enriched my life at the Department of Chemistry, Gujarat University. I offer my special thanks to the teaching and non-teaching staff members of Chemistry Department for their generous help, goodwill and cooperation during the course of this work. I find words inadequate to express my feelings of joy, for the affection and the encouragement
which I received from my friends and colleagues at the Chemistry Department; too many to name individually. I would like to mention my special thanks to Ms. Nejal Bhatt who has had travelled this same journey alongside me. She has been a constant source of motivations and optimism in all critical phases, especially when my morale ebbed and enthusiasm waned; a feat that can never be paid back in feelings or words. Put simply, I have never met anyone who believes in me more: Thank you for making me more than I am.

The real strength behind me is my family, where the most basic source of my life energy resides. No amount of words can express my gratitude towards them. I dedicate this thesis and all my efforts to my loving family, especially my parents. Thanks are also due to my lovely sisters who are so supportive in whatever I do in my life. I appreciate my nephews: Vishvajit, Pratipal and Aviraj, who always provided a very pleasant environment during my visits to them. This gave me lot of freshness and energy to pursue my research work more vigorously.

At last I would, in all my humility, like to put on record my deep sense of indebtedness to all those who have contributed directly or indirectly in transforming the idea into a reality in the form of this thesis.

“Things won are done; joy’s soul lies in the doing.”

-William Shakespeare
