

Acknowledgements

This thesis is the outcome of assistance and constant motivation of many individuals. It has been a period of intense learning for me at both scientific and personal levels. Therefore, I take this opportunity to extend my sincere gratitude and appreciation to all those who made this Ph.D thesis possible.

At first, I take this opportunity to express my deep sense of gratitude to my supervisor Prof. Amitabh Krishna for suggesting me the topic of my research and for his support and guidance. His interest, motivation, and great efforts in research extremely encouraged me in my studies. He gave me freedom to explore my intellectual interests and helped me to realize the power of critical reasoning. His student friendly and co-operative nature is highly admirable. This thesis would not have been possible without his support, patience and guidance during the experimental and writing process. I owe you lots of gratitude for having shown me how to be a good teacher, supervisor and a kind person.

I am also extremely indebted to present head Prof. M.K Thakur and former heads of the Department Prof. C. M. Chaturvedi and Prof. C. Haldar for providing the departmental facilities during the course of the present work,

I would like to thank the members of the Research Plan Committee Prof. C. Haldar, Prof. S.K. Singh, Prof. S.B. Agrawal (Dept. of Botany) and Prof. G Narayan (Dept. of Molecular and Human Genetics) for their excellent advises and detailed review during the preparation of this thesis.

I am grateful to Dr Puran Bora (Department of Ophthalmology, Jones Eye Institute, Pat & Willard Walker Eye Research Center, University of Arkansas, USA) for providing me adiponectin peptide and to for all the support and suggestions provided by him. His prompt reply to my queries needs real appreciation and thanks. My sincere thanks goes to Dr. Anita Simlot and Dr. S. K, Mathur (Sawai ManSingh Medical College and hospital, Jaipur, India) for providing the human samples. I extend my sincere thanks to Prof. R. Sridaran for his useful suggestions and remarks.

I want to express my deep thanks to my senior laboratory members, Dr. Arnab Banerjee, Dr. Ajit Singh, Dr. Shabana Anjum, Dr. Anuradha, Ms. Rachna Verma and Mrs. Anushree Dave, who helped me to get acquainted with several techniques, offering valuable suggestion and support during the entire period of the study. My special words of thanks to my lab members Mayank, Parikha, Ashutosh and Sangeeta for their kind cooperation and encouragement whenever I needed. I am also thankful to Mr. Shishir, Mrs. Priyadarshini Mr. Ankur, Ms. Shilpi and Ms. BhumiKa for their kind cooperation, encouragement, good company and suggestions throughout my research period.

I am thankful to my laboratory attendant, Mr. Mahendra Yadav (Pintu) for his help in caring and handling the animal and doing all assistance.

The completion of my research work is only possible due to the unconditional love and support of my beloved parents and dear sister Nimisha. I bestow my humble gratitude for their patience and sacrifice.

I gratefully acknowledge financial support from UGC and CSIR in the form of research fellowship.

Above all, I thank the almighty god for all the grace and blessings.

Anusha Singh

Preface

The polycystic ovary syndrome (PCOS) is one of the leading causes of infertility due to anovulation in women. It affects upto 10% women of reproductive age and over 75% of all cases of anovulatory infertility. It is multifactorial disorder characterized by chronic anovulation, hyperandrogenism (HA), hyperinsulinemia (HI), insulin resistance (IR), polycystic ovary and recurrent miscarriage. About half of women with PCOS are obese. The mechanism of anovulation is uncertain, but there is evidence of incomplete development of antral follicle, which might be due to abnormal interaction of insulin and luteinizing hormone (LH) on granulosa cells. Decreased fertility in PCOS may also be due to changed levels of gonadotropin-releasing hormone, gonadotropins, HA and HI. Despite the prevalence of PCOS worldwide, a clear understanding of the aetiology, pathophysiology and treatment of this syndrome remains inconclusive. The heterogeneous pathophysiology of PCOS results in a number of constraints for its management. If PCOS is not corrected, it may lead to other serious consequences such as Type II diabetes mellitus, cardio-vascular diseases, ovarian and endometrial cancer, depression etc. Thus, PCOS is a major issue for women's health with ramifications well beyond the reproductive age.

HA is considered as a core feature of PCOS since it can be induced by treatment with large dose of androgen. About 70-80% of women with HA are diagnosed with PCOS. HA is also the major factor behind most clinical manifestation of PCOS. Insulin resistance followed by HI is regarded as the second most important factor responsible for development of HA and other PCOS-like features. Besides HA and abnormal insulin secretion and action, defects in neuro-endocrine regulation lead to hyperpulsatility of GnRH secretion and obesity related metabolic dysfunctions. These are the two important factors responsible for manifestation of PCOS. Because the primary cause of PCOS is not yet precisely known, treatment is mainly directed to the symptoms of the disorder. Currently, reversing HA and IR or inducing ovulation in women with PCOS constitute the fundamental approach for the management of PCOS. Although the drugs such as anti-androgen-spiroglactone; insulin sensitizers-metformin and ovulation inducer-clomiphene citrate are often being used to induce ovulation and pregnancy in PCOS, but effective treatment to manage PCOS is still a challenge. The obesity factor and neuro-

endocrine/hypothalamic regulator are relatively understudied factors that may play important role in the development and manifestation of the PCOS.

Therefore, in the present study the obesity factor, adiponectin and hypothalamic factor, kisspeptin, are selected to evaluate their role in development of PCOS-like features in the mouse. The information obtained through studies on mouse-model may help in developing suitable therapeutics for PCOS treatment in humans. Further, it is thought out to examine the physiological role of adiponectin and kisspeptin in the ovary of cyclic mice. In order to confirm the pathophysiological role of adiponectin and kisspeptin in women with PCOS, a preliminary study is also performed in the ovaries of normal and PCOS women.

The study incorporated in this thesis is broadly divided into three sections. **Section-I** describes the role of obesity factor, adiponectin on ovarian activities of normal and PCOS-induced mice. This section is divided into two chapters. **Chapter 1** incorporates the effects of adiponectin on ovarian activities of normal mice. **Chapter 2** describes the effect of adiponectin on ovarian activities in PCOS mice. This chapter is subdivided into part 2.1 and 2.2 describing the effect of adiponectin on ovarian activities in PCOS-induced mice *in vitro* (Part 2.1) and *in vivo* (Part 2.2). **Section-II** incorporates the studies demonstrating the role of hypothalamic factor, kisspeptin on ovarian activities of normal and PCOS-induced mice. This section is also divided into two chapters. **Chapter 3** deals the effects of kisspeptin on ovarian activities of normal mice. **Chapter 4** describes the effect of kisspeptin on ovarian activities of PCOS-induced mice. **Section-III** includes **Chapter 5** which incorporates the comparative studies demonstrating the immunolocalization of GnRH, GnRH-R, Kisspeptin and Adiponectin on the ovary of normal and PCOS women.
