Acknowledgements

The pursuance of this higher degree has been a life time journey and I had the privilege of reaching the final goal and I am thankful to the God Almighty for providing me the perseverance and courage to face the hurdles so far. In this journey, the role of my research guides Professor A. G. Ananth and Professor H. M. Mahesh has been monumental and they have provided necessary guidance, encouragement and when necessary the required confidence building-talks that motivated me to face the hardship and to achieve the final goal. Without their constant monitoring, regular reviews and patient hearing, the thesis would not have been possible and I am thankful to their insight and patience all through this period.

The research topic being a system concept and realization in a multi-disciplinary area of "Concepts of Autonomous Space Missions", a host of people have directly and indirectly contributed in evolving the ideas and methods. Specifically, during the years when I had been the Director of the ISTRAC, Bangalore and also Chair of the many ISRO committees such as Ground Segment Committees, several PDR and CDR committees for several Indian Space Missions, the wisdom and knowledge of the whole ISRO community has been poured and acquired over the years and they have been adopted in the thesis. The experience has helped enormously in building this thesis and further my own insights and my grandeur plans for future of ISRO, have been transformed into a thesis report and has been presented. Predominantly, my heartfelt thanks are due to my former colleagues from ISTRAC, specifically Mr. M. Pitchaimani and his entire team, who have constantly enlightened me about various aspects of spacecraft operations, problems, solutions etc., without which the thesis could not have been conceived and thought-out in this fashion presented. Being part of Mission Planning Group since my earlier years at ISAC, I have been fortunate to understand the Mission Goals and am in greater appreciation of larger efforts by several spacecraft teams from Mission, Flight Dynamics and Control Dynamics Group. Specifically, I take this opportunity to recognize, appreciate and thank the Mission Group led by Dr. V. Keshavaraju and team, the Flight Dynamics Group led by Mr. N. S. Gopinath and team and the Control Systems Group led by Mr. K. Parameswaran and team. Their constant support and participation in spacecraft building, implementation of several concepts and methods have helped to realize autonomous functions on spacecrafts and also helped testing and validation.

Finally I thank ISRO for providing me an opportunity to pursue my doctoral degree and for providing me all the necessary support to complete the same. My sincerest acknowledgement of the sacrifices rendered by my wife and daughters and for accepting me with my idiosyncrasies over the years and also during the time of pursuing this degree.
Dedicated to My beloved
Family
