CHAPTER IX
RECOMMENDATIONS

The study can be replicated on a larger group to validate and generalize the findings. Observations of the performance of screening sessions by women should be done monthly at least for one year to assess the regularity of screening practices.

On the basis of this study, the following recommendations have been made for further studies.

1. Further studies related to early and late complications of cervical cancer, and role of various other less expensive techniques of screening to detect cervical cancer among rural women can be conducted.

2. An experimental study can be conducted on the different methods on teaching - pamphlets, video and discussions, demonstrations their effectiveness.

3. Educational programme can be designed to create an awareness among women to clarify wrong beliefs and to enhance practice of regular screening. Emphasis should be given to married, multiparty and elderly women since they are tend to get neglected.
