Abstract IV

Chapter 1 1-13

Introduction

1.1 General Overview 1
1.2 Conformational Preferences of IDRs 1
1.3 Sequence Properties of Disordered Regions 3
1.4 Existence of Disordered Conformation in vivo 3
1.5 Identification of Disordered Regions and Proteins 4
   1.5.1 Experimental Methods 4
   1.5.2 Computational Methods 5
1.6 Functional Roles of Disordered Regions 8
1.7 Binding to Interaction Partners 10
   1.7.1 Coupled Folding and Binding 10
   1.7.2 Transient Binding 10
   1.7.3 Higher Rate of Binding 11
   1.7.4 Binding to Multiple Partners 11
   1.7.5 Disordered Regions as Sites for Post-Translational Modification 12
1.8 Disordered Proteins are Involved in Many Diseases 12
1.9 Thesis Objectives and Approach 13

Chapter 2 14-29

Intrinsic Disorderness as a Mechanism for PEST Mediated Degradation

2.1 Introduction 14
2.2 Materials and Methods 15
   2.2.1 Sequence Data 15
   2.2.2 Structure Data 16
   2.2.3 Gene Ontology Data 16
   2.2.4 Prediction of PEST Regions 17
   2.2.5 Disorder Prediction 17
   2.2.6 N/C Terminal Definition of Proteins 18
   2.2.7 Statistics 18
4.3 Results

4.3.1 Higher Disorderness in Transcriptional Hubs
4.3.2 Target Hubs do not Show Higher Disorderness
4.3.3 Disordered TFs Cause Growth Inhibition When Overexpressed

4.4 Discussion

Chapter 5

Effect of Expression Levels on the Disorderness of Proteins

5.1 Introduction
5.2 Materials and Methods
5.2.1 Yeast Abundance Data
5.2.2 E. coli Solubility Data
5.2.3 Disorder Prediction
5.2.4 Gene Ontology Analysis
5.3 Results
5.3.1 Highly Expressed Proteins are Less Disordered
5.3.2 Translational Robustness of Disordered Proteins
5.3.3 Higher Solubility of Disordered Proteins
5.4 Discussion

Summary and Conclusions

Future Directions
